About This Book

This book describes the inner workings of a relatively obscure video game created by an eccentric Englishman by the name of Jeff Minter in 1986 for the Commodore 64.

Iridis Alpha was not an enormous success on its release but it is widely regarded as one of the great achievements on Commodore 64 hardware. It embodies an 8-bit arcade aesthetic that was unique to its time, it was slightly mad in its concept and execution, and its emphasis on speed and unforgiving gameplay influenced generations of game developers in the years that followed.

But this book is not just the description of an old computer game. It is a tour through computer technologies that could justifiably be considered antique yet which are still relevant both to the creation of computer games and to the programming of computers in general.

Modern computer games can involve hundreds of people in their creation, but in 1986 the majority of games were conceived and executed by individuals working entirely on their own like Jeff Minter. The difference is not just one of scale but complexity. The detail that underlies a computer game from 1986 can fit between two covers with relative ease because the programmer was working directly with pixels on the screen (not to mention soundwaves from a speaker) and was constrained by physical limitations to achieve their goals using as few computer cycles and as little computer memory and storage as possible. Modern computer games on the other hand are a layer cake of infinitely dense detail we couldn't possibly hope to capture in their totality in a single book. With something as small as Iridis Alpha on the other hand, which is just 54,000 bytes, we can understand its operation at the lowest level and set out the challenges and solutions involved in making a very fast game on slow hardware. The techniques and tricks we discover are as important today as they were in 1986.

This book is also an introduction 'by example' to the lingua franca of all computers (even those we use today): assembly language. The flavour of assembly language we learn about here, 6502 Assembly, is no longer in contemporary use but it is one

of the ancestors of the languages used in modern processors. Its relative simplicity and clarity makes it the ideal primer for learning the principles of programming in 'machine code' and understanding how computers work at a fundamental level. Strip away the abstraction and indirection provided by modern programming languages such as Python, Java, or even 'C', and you are left with enormous mounds of apparently indecipherable assembly language instructions. In this book I hope to show you that these instructions can be deciphered, and were once a viable way of programming computers.

Finally, this book cannot help being a very specific description of the way the Commodore 64 itself worked. The Commodore 64 was one of the most successful home microcomputers ever made. Along with the Apple II and the BBC Micro it was computing's first step into the home. Although they enabled new uses of computers, and marked the advent of video games in people's living rooms, these machines were still simple creatures. And because the Commodore 64 was such a basic computer in so many ways, what we end up learning about in this book is a recognisable implementation of a foundational concept in information theory: [the Turing Machine](#). 64 kilobytes of integrated circuit memory is almost all the C64 has to play with: there is no hard disk to speak of. So on our journey we find ourselves with a long Turing-style memory 'tape' on which our assembly language instructions operate, hopping back and forth along the 65,536 slots on the tape writing and reading values which the computer hardware translates into sound and vision. Understanding the code of a video game on an old computer, it turns out, is a great way to introduce ourselves to the practical details of computer science's first 'big idea'.

On the other hand, maybe you are just curious. Maybe you just want to learn the detailed mechanics of how to make a glorified digital breadboard such as the Commodore 64 produce something on a screen that flashes, bleeps, and fascinates the viewer. If so, then this book was written for you.

Overview of the Chapters

Since the source code of Iridis Alpha is no longer available, I have had to [unpack and reinterpret](#) it from the game binary Jeff Minter [released into the public domain in 2019](#). I describe this reverse-engineering process in the opening chapters because I think it is an interesting exercise in and of itself to go from a binary blob to a set of fully commented source code that provides insight to the inner workings of the game. [A Little Archaeology](#) describes how we extract the game binary from the cassette tape on which it was originally distributed. [Some Disassembly Required](#) shows you how to go from a very long list of bytes to a full source code listing. Hopefully you are here because you enjoy this kind of gory detail too.

If you are just interested in learning about the mechanics of the game itself you can flick straight to [The First 16 Milliseconds](#), which begins by covering the loading the title screen and all that goes on in there. [Making Planets for Nigel, Blasting Fast and Slow](#), and [Enemies and Their Discontents](#) cover the main gameplay and dive into how the game levels are created and how the speed of the game is achieved. These chapters go deep into the game's reassembled code and look closely at how Jeff Minter designed its core engine.

I dedicate a full chapter [A Hundred Thousand Billion Theme Tunes](#) to the ingenious procedural programming behind Iridis Alpha's theme tunes and trace its inspiration back to an article 'Musical Fractals' in a 1986 issue of Byte magazine. [Another 16⁴ Tunes](#) looks at the early experimentations with this fractal music in the demo program 'Torus' that Minter released while developing Iridis Alpha. It also delves into the animation experiment it contains, something that was used in the bonus screen in Iridis Alpha itself.

Iridis Alpha is full of little additional extras. [Congoatulations Hotshot!](#) unpacks the vertical scrolling mini-game Minter inserted as a bonus sequence. Even if the game itself is a little half-baked this bonus sequence is full of intrepid effects and some clever techniques for generating the game maps. [Made in France](#) and [A Pause Mode for Your Pause Mode](#) unpick the pause mode games bundled with the main game.

As a final coda, [Iridis Oops!](#) takes a look at some of the bugs that slipped through to the final release.

If you are reading the PDF version of this book the [Appendices](#) contain a data dump of sprite sheets, character sets, maps and tables that should provide hours of rewarding bedtime reading, or more likely, deep undisturbed sleep.

Note on the Text

If you find the writing hard going or the attempts to explain things difficult to follow, by all means [leave me a note](#) and I will gratefully accept your complaint. In the meantime, please skip over any blemishes to the next pretty picture or promising-looking block of text.

The full source code is available in [its own Github repository](#). You should find that it matches exactly the snippets of code provided in the book, though in some cases the extracts in the book have been edited and reformatted for brevity.

IRIDIS ALPHA THEORY

We Need to Talk About Binary

Here we are, ground zero in every book about assembly programming. Where the reader finds themselves in an awkward sit-down discussion about the B word: Binary. It's a necessary evil of course. Nothing will ever make sense without a rudimentary but slowly developing grasp of what bytes are and why they keep being referred to in a confusing mixture of letters and numbers such as \$D012 and \$F4.

So what am I supposed to do with you here? Succeed where every other author has usually failed? I assume that's the expectation. OK here goes.

You already know (OK *maybe* you already know) that computers, even those in the 1980s, understand everything in terms of 1s and 0s. All they know is a world in which something is on or off, high or low, present or absent. The reason for this is simply because yes/no and on/off are so fundamental to the reality of very small things. Once you break anything down far enough you are always left with a simple question of there being somewhere or nothing. The idea of a 1 or a 0 as the simplest possible building blocks for every single thing is not so outrageous. You put enough 1s and 0s together in a row you can build patterns that repeat and create larger patterns and suddenly you find yourself with a string of 1s and 0s that means something.

The idea of on/off is so simple even a computer can understand it. If you feed it a signal all it has to do is determine whether it is one or the other and store the result. Then read the next signal. And before long the computer has a sequence of 1s and 0s it might be able to do something with.

So when you are programming a computer or in our case trying to understand how it was programmed to give us Iridis Alpha you have to be able to visualize how the computer has stored all the ones and zeros it has been given and how it shuffles them around. An unruly mound of 1s and 0s is not much use when operating on them intensively. There has to be some benefit to splitting up the blob in some way that allows

some order to be imposed. Some way of segmenting a string of 1s and 0s that is both useful to us as the programmers and an efficient way of directing the computer to make effective use of the amorphous binary goo fed into it.

Trial and error has eventually arrived at an optimal arrangement, one which you have definitely heard of: this is the byte. The idea of the byte is simply to divide and conquer. We take any string of 1s and 0s and split them up into segments of eight. We now consider ourselves to have a string of bytes and we call each of the individual 1s and 0s bits.

Any scheme that reduces the number of items we have to deal with is a boon, but is there any rhyme or reason to choosing 8 as our magic number instead of say 7, or 12? Believe it or not, the number 8 was chosen (after much experimentation with others) almost solely because it proved the easiest and most convenient for people to deal with when understanding how they would make computers work.

The reason a byte of 8 bits is so convenient to deal with is because of the number of different values it can represent and the compact notation this particular number allows. Having a convenient notation system that allows humans to compose larger values from smaller values is surprisingly important when it comes down to it. It is humans doing the important part of the computing: making the big decisions, figuring out where things go and how they should work. The computer is just a glorified bit shuffler for which everything is on or off, it has no concept of a bigger picture. Humans need to be able to at least intuit some of this shuffling with a mental model of what happens when one set of ones and zeros is clashed with another. Using the magic number of 8 as the denominator for batches of bits enables this simple mental model.

The first great thing about 8 is that it can be divided into two. That is, into two segments of 4 bits. The great thing about a sequence of four 1s and 0s is that it has 16 possible permutations. That's to say it can be ordered in sixteen unique ways. Yet another way, is to say that a sequence of 4 bits can store up to sixteen different values.

Value	Bits	Value	Bits
0	0000	8	1000
1	0001	9	1001
2	0010	10	1010
3	0011	11	1011
4	0100	12	1100
5	0101	13	1101
6	0110	14	1110
7	0111	15	1111

The 16 different permutations of four 0s and 1s.

You have to agree this is marvellous stuff. But what is so convenient about a number between 0 and 15? If you're using decimal notation it's not convenient at all, in some cases you end up having to write two whole characters rather than one. We could avoid that if we invented a system that allowed a single character for each of the 16 values.

For example 0-9 for 0-9, and A-F for 10-15. Seems a bit clunky. But it works.

Value	Bits	Value	Bits
0	0000	8	1000
1	0001	9	1001
2	0010	A	1010
3	0011	B	1011
4	0100	C	1100
5	0101	D	1101
6	0110	E	1110
7	0111	F	1111

The 16 different permutations of four 0s and 1s but with letters too.

On the other hand, congratulations, we've just invented hexadecimal.

The genius of this system is that it allows us to write every possible sequence of 8 bits with just two characters.

Value	Bits	Value	Bits
00	00000000	80	10000000
01	00000001	81	10000001
02	00000010	82	10000010
.	.	.	.
7D	01111101	FD	11111101
7E	01111110	FE	11111110
7F	01111111	FF	11111111

The 256 different permutations of eight 0s and 1s, with a gap in the middle for reasons of space.

But that is not its only benefit. When we look at any specific number using this notation we can almost immediately tell how the bits in it are set, without needing to memorize all 256 possible permutations.

This is possible because we can start by looking at either character in the two-

character notation and quickly divine the 1s and 0s that make it up. We can do this because each character represents a value between 0 and 15 that is made up of some combination of 8, 4, 2, and 1 - each representing a bit from left to right.

8	4	2	1	Decimal	Hex
0	0	0	0	0	0
0	0	0	1	1	1
0	0	1	0	2	2
0	0	1	1	3	3
0	1	0	0	4	4
0	1	0	1	5	5
0	1	1	0	6	6
0	1	1	1	7	7
1	0	0	0	8	8
1	0	0	1	9	9
1	0	1	0	10	A
1	0	1	1	11	B
1	1	0	0	12	C
1	1	0	1	13	D
1	1	1	0	14	E
1	1	1	1	15	F

The 16 different permutations of four 0s and 1s but with letters too.

"All" we have to do when confronted with a single hexadecimal digit like 9 is figure out that its made up of 8 and 1 in order to know that the bits are set as follows:

8	4	2	1	Decimal	Hex
1	0	0	1	9	9

Likewise with the slightly more inscrutable D. Since F is 15, D must be 13. And 13 is made up of 8, 4, and 1:

8	4	2	1	Decimal	Hex
1	1	0	1	13	D

The ability to do this is especially important when doing the low level programming

that is typical of assembly. We'll see plenty of examples in future chapters but here is a taste of the kind of operation we ask a computer to perform by expressing our intentions using hexadecimal notation for binary.

Imagine we have a value from some random source stored in a byte. Imagine we happen to be in need of a random number, for example to select a random planet to use the next time we run attract mode in Iridis Alpha.

This random number we have stored in a byte sounds like it should be useful to us, but since its random it can be any value between 0 and 255 and since we only have four planets to choose from what we need is a number between 0 and 3.

A simple binary operation provides a way of solving this problem and our hexadecimal notation gives us a straightforward way of expressing it.

First the binary operation itself. Let's say our random value is a string of bits like 01011010 which is 5A in hexadecimal.

8	4	2	1	8	4	2	1	Decimal	Hex
0	1	0	1	1	0	1	0	90	5A

Since we only want a value between 0 and 3 we can extract out just the last two bits to give us that number. In other words, if we set all the bits to zero except the last two we would have a number between 0 and 3:

8	4	2	1	8	4	2	1	Decimal	Hex	
0	0	0	0	0	0	0	1	0	2	02

We can ask the computer to do this for us by asking it to compare 01011010 with 00000011 and give us a result where all the bits in both are 1.

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$5A	0	1	0	1	1	0	1	0
\$03	0	0	0	0	0	0	1	1
Result: \$02	0	0	0	0	0	0	1	0

AND'ing \$5A and \$03 gives \$01 (1). For AND to give a 1 both bits must be 1.

Notice that in this new bit string we've set the bits that we're interested in to 1. This is called an AND operation. We have used 00000011 to mask out the bits we're not interested in and hence turn a random number between 0 and 255 into a random number between 0 and 3, in this case: 2.

Our choice of 8 as a magic number becomes slightly less magical when we realize that we never had all possible numbers to choose from in the first place. Sure we could have chosen 7 or 9 or 13 but how practical would this really be when the actual value assigned to any individual bit is always going to be a power of 2. Even if we could never precisely intuit the reasons as to why, a magic number that is also the power of 2 (e.g. 8, 4, 16, 64) is always going to make things easier over the long haul even if we can't articulate them.

So now some jargon we might have heard in the past is starting to make sense. The Commodore 64 was an '8-bit computer'. What this means is that its basic unit of currency is the 8-bit byte we've invented here. Every time it performs an operation it does so using a single byte as its fundamental building block. This is true whether we're talking about the AND operation or storing a value for use later on. When we give the C64 a value it's always a single byte. The subsequent era of 16-bit computing (e.g. the Amiga) took this a step further by introducing a two-byte block as its basic unit of currency. 32-bit and 64-bit computing are the *lingua franca* of modern processors - no matter how small the value we're using it will be managed as 4-byte or 8-byte value respectively by 32-bit and 64-bit computer architectures.

But even the C64 had use for values larger than 255. In fact it could handle staggering numbers as large as 65,535 using a little sleight of hand to put two bytes side by side and treat them as a single number.

This was as far as its ken could reach however. And since it could look no further than 65,535 that imposed an upper bound on the number of values it could reach for at any given time. This finite horizon is known as its address space. When we want to store a value in the C64's memory we only have 65,536 slots available to specify or select from. The address we choose must be between \$0000 (0) and \$FFFF (65,535).

43	36	34	00	40	..	41	50	45	DE	A2
\$0000	\$0001	\$0002	\$0003	\$0004	..	\$FFFC	\$FFFD	\$FFFE	\$FFFF	

Figure 1.1: The C64's memory visualized as a long strip of 65,536 slots, each holding a byte represented in hexadecimal.

This upper limit is what gives the Commodore 64 its name. It has 64 kilobytes of memory.

Hex	Decimal	Meaning
\$0400	1024	1 Kilobyte
\$FFFF	65,535	64 Kilobytes

Some magic numbers when dealing with bytes.

This is all we need to get started. The rest we can pick up along the way. So let's start.

A Little Archaeology

Iridis Alpha was distributed on cassette tape by the publisher Hewson Consultants. Normally used to play audio, cassette tapes were the cheap and ubiquitous medium *du jour* of the 1980s and a natural choice for the nascent 8-bit game industry to distribute its wares.

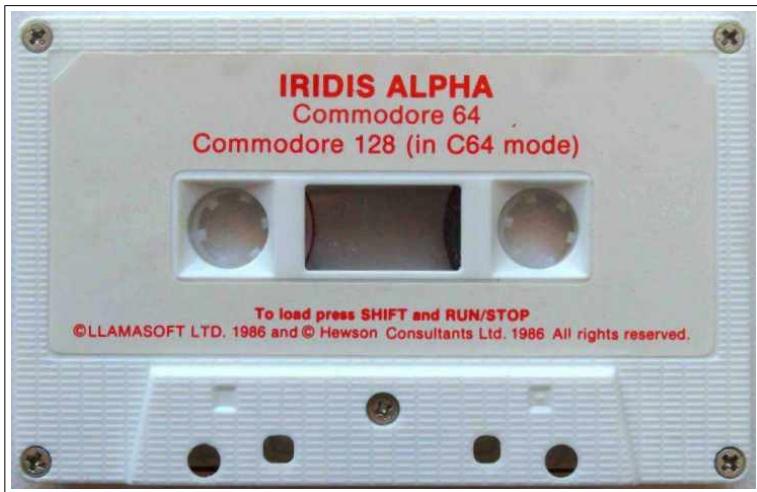

Figure 2.1: It should be simple getting bytes off this right?

You don't have to look at the picture of Iridis Alpha's cassette tape above to notice that it doesn't contain an awful lot of tape. This gives you an idea of how little data we are actually dealing with when it comes to the size of program that the C64 could cope with. The spool contains a 'mere' 54 kilobytes of target data. Even when encoded in the elaborate way we are about to describe this still does not result in a large physical

medium. As you may already appreciate, 54 kilobytes is a fraction of the average file size we are used to dealing with today, where even a single image on a web page will run to hundreds of kilobytes.

Playing a cassette tape for a C64 game such as Iridis Alpha on a normal cassette tape player would be an ear-splitting mistake. Instead of music you would be subjected to a cacophony of mechanical chirruping. This is the tape attempting to convey to you its long stream of binary data in the only language available to it: lots of sound waves of varying length. The Commodore 64 came equipped with a specially-adapted cassette player of its own to cope with this racket. This player could read the sounds encoded on a cassette tape and transmit them as a series of pulses into the C64's main CPU board, so that they could be used for their intended purpose: interpretation as bytes of data.

Without knowing how it's actually done, it's tempting to imagine a variety of possible schemes that might have been used to store data on a cassette. For example, one sound wave denoting a '0' and another one denoting a '1'. The method that is actually used isn't very far away from such a thing but there is plenty of intricacy layered on top, particularly in a bid to spend as little time as possible loading data from the tape.

In order to get something to work with on our modern computers, we must first somehow convert the contents of the cassette tape into a binary file on our computer's hard disk and then emulate the steps the C64's tape player performed to read the sounds from the tape. Only then can we load them into memory as something that could be run as a computer program.

The earliest and most durable attempt at standardizing this procedure was from Per Hakan Sundell in 1997. He invented what is now known as the 'tap' format for representing the beeps and bleeps encoded on the tape as a file of bits and bytes. The idea is that each byte in the tap file represents the length of a pulse encoded on the tape. It is the length of these pulses that will ultimately tell us whether we should interpret a value of 1 or 0. When we get eight 1s and 0s we have a byte. We get enough bytes, we have a program we can run!

Someone, somewhere has kindly decoded the contents of the Iridis Alpha cassette tape distribution to a tap file for us. So we have something to dig into. This is going to be a slightly bonkers journey into the bowels of decoding a 54KB game file from over 500KB of raw data. Every time you think you are nearly done there will be yet another convolution to wrap your head around. But at the end of it we will finally have our binary game file and will be ready to figure out how to decipher it into something approximating the original 6502 assembly language Jeff Minter used to write Iridis Alpha in 1986.

Figure 2.2: Simple, right? In this visualisation of a fully wound cassette spool containing Iridis Alpha each short-pulse sound is represented by a light grey pixel, each medium-duration pulse by a blue pixel, and each long pulse by a pink pixel. Roughly speaking, grey is a shorthand for 0 bits and dark pixels for 1 bits.

2.1 The Madness Begins

In the table below we show what the start of the our `iridis-alpha.tap` file looks like. Note that this table presents the the contents of the start the of tap file rather than the data on the tape itself. The data on the tape is represented by the white cells in our diagram. The coloured cells are header information specific to the tap file format and do not represent data on the tape. The purpose of this header info is make it obvious to anyone inspecting `iridis-alpha.tap` that it it contains raw sound information captured from a cassette (C64-TAP-RAW), as well as providing the version of the tap specification used when creating the file and the total length of the data in the file:

43	36	34	2D	54	41	50	45	2D	52	41	57	00	00	00	00
5A	0A	08	00	00	5D	32	2F	30	2F	2F	30	30	31	30	31
30	31	31	2F	31	31	30	31	30	30	31	30	30	31	30	30
31	31	30	31	31	30	31	30	30	31	30	31	31	30	30	30
31	31	31	30	30	31	30	31	31	31	30	30	30	31	31	30
30	30	31	30	31	30	30	30	31	30	31	31	30	30	30	31

Figure 2.3: The first batch of data we read in from the ‘tap’ file. The ‘Header Description’ is in grey, the Version Number in pink, Reserved bytes in blue, and the File Size in red.

Field Description	Field Value	Note
TAP Format Header Description	43 36 34 2D 54 41 50 45 2D 52 41 57	‘C64-TAPE-RAW’ in ASCII
Version	00	Version Number 0
Reserved	00 00 00	Used for format versions 0
File Size	5A 0A 08	\$080A05, in decimal: 526,853 bytes long.
Start of Data	00 00 5D 32 2F 30 2F 30 30 31 30 31 30 31 31 2F 31 31 30 31 30 30 31 30 31 30 31 31 30 31 31 30 31 30 30 31 30 31 30 30 31 31 31 30 30 31 30 31 31 31 30 30 31 30 30 30 31 30 31 30 30 30 31 30 31 31 30 30 31 31 31 30 30 31 30 32 31 30 31 30 30 32 31 30 30	Bytes representing the individual pulses/sounds on the tape.

Figure 2.4: The meaning of the first batch of data we’ve read in.

After the header information described above, each byte in the tap file represents the pulse length or duration of a single sound emitted by the tape. A pair of sounds taken together represent a single bit, i.e. a 0 or a 1. A medium length sound followed by a short length represents a 1, a short length followed by a medium length represents a 0.

The following table shows us whether we should consider a byte on the tape to represent a short, medium, or long duration sound:

Sound Length	Lower Range	Upper Range
Short	\$24	\$36
Medium	\$37	\$49
Long	\$4A	\$64

Figure 2.5: Values for short, medium, and long pulses. For example, any byte value on the tap file between \$24 and \$36 would be considered a ‘Short’ pulse.

Remarkably the first 27,000 or so pulses on the Iridis Alpha tape are nothing but short sounds (values between \$2F and \$31) so cannot be interpreted as anything. These would have been ignored by the C64 when reading the tape and so can be ignored by us. It's not until the 27,157th byte in the tape that we start to encounter real data:

```

00006a10: 3031 3031 3156 4144 3130 4231 4243 3130 01011VAD10B1BC10
00006a20: 4231 4131 4244 312f 4057 4032 4231 4231 B1A1BD1/@W@2B1B1

00006a80: 3230 4231 4231 4231 4243 3142 2f54 4245 20B1B1B1BC1B/TBE
00006a90: 3141 3130 4231 4231 4230 4230 4243 3030 1A10B1B1B0BOBC00

```

Listing 2.1: Data finally gets started at '56 41' in the first line above.

The first meaningful twenty bytes therefore are:

```
56 41 44 31 30 42 31 42 43 31 30 42 31 41 31 42 44 31 2F 40
```

You get a sense of how wasteful, or ahem redundant, this encoding scheme is when you learn that these twenty pulses are required to give us a single byte. The table below shows how we interpret them to construct a series of 1s and 0s.

First Byte	Second Byte	First Byte Pulse Length	Second Byte Pulse Length	Meaning
\$56	\$41	Long	Medium	Start of Byte Indicator
\$44	\$31	Medium	Short	\$01
\$30	\$42	Short	Medium	\$00
\$31	\$42	Short	Medium	\$00
\$43	\$31	Medium	Short	\$01
\$30	\$42	Short	Medium	\$00
\$31	\$41	Short	Medium	\$00
\$31	\$42	Short	Medium	\$00
\$44	\$31	Medium	Short	\$01
\$2F	\$40	Short	Medium	Parity Bit of \$00

Figure 2.6: Interpretation of the first 20 meaningful bytes creating a byte. The parity bit at the end is a \$00 if there are an odd number of 1s, and \$01 if there are an even number of 1s. 10010001 has an odd number of 1s.

We can visualize the twenty bytes as a square sound wave. When reading the tape the C64 would interpret these sound pulses as long, short, or medium to construct a meaning for the entire sequence.

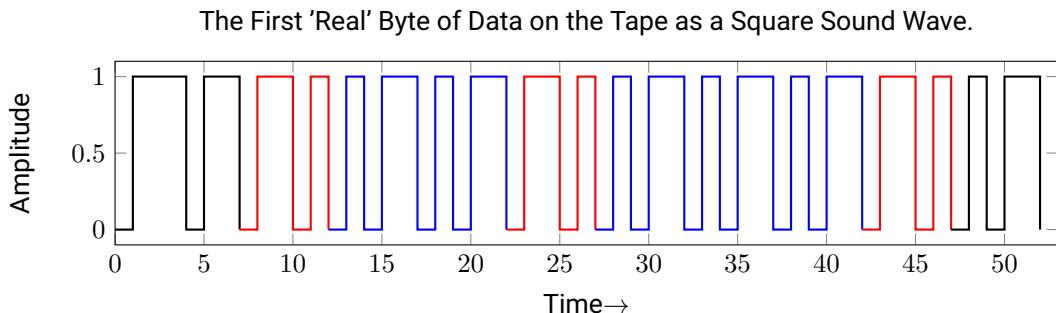

Figure 2.7: Medium-Short pairs in red represent a '1' bit, Short-Medium pairs in blue represent a '0' bit. So this gives us '10010001'. The black wave form at the beginning is the 'Start of Byte' indicator and the one at the end is a parity bit.

Take your time to compare the wave diagram above with the table on the opposite page. We're representing the same data in two different ways here, with the wave pattern illustrating the sound form that the cassette reader would have received and translated into the zeros and ones that will make up our first byte.

Once we've extracted our result of 10010001 from these twenty bytes we now must reverse it. We must do this because the bits are encoded on the tape with the 'most significant bit' first and we are used to reading binary with the 'least significant bit first'. In hexadecimal the reversed bit-string of 10001001 is \$89.

We have our first byte! It's \$89!

2.2 After Our First Real Byte

With this precious commodity in hand we now continue reading off bytes in the same manner from the tape. Eventually we encounter a signal that tells us we've reached the end of the data block, a 'Long-Short' sequence. When this happens we find we've read 202 bytes in total:

89	88	87	86	85	84	83	82	81	03	A7	02	04	03	49	52
49	44	49	53	00	00	00	00	00	00	00	00	00	00	78	A9

C6	F8	10	F4	A5	F7	60	00	00	E4						

Figure 2.8: The data we've read in so far. The unshaded section is machine code.

Fortunately this data has a meaning. It contains the first part of a machine code program the C64 can execute:

Field Description	Field Value	Note
Countdown	89 88 87 86 85 84 83 82 81	Data Block Header
File Type	03	03=PRG, i.e. executable machine code.

End Address	04 03	End Address to load to: \$0304
Filename	49 52 49 44 49 53 00 00 00 00 00 00 00 00 00 00 00 00	Filename: "IRIDIS"
Machine Code	78 A9 6E 8D 06 DD A2 01 20 D4 02 26 F7 A5 F7 C9 63 D0 F5 A0 64 20 E7 03 C9 63 F0 F9 C4 F7 D0 E8 20 E7 03 C8 D6 F9 00 F0 D6 20 E7 03 99 2B 00 99 F9 00 C8 CO 0A D0 F2 A0 00 84 90 84 02 20 E7 03 91 F9 45 02 85 02 E6 F9 D0 02 E6 FA A5 F9 C5 2D A5 F5 E5 2E 90 E7 20 E7 03 C8 00 58 18 A9 00 8D A0 02 20 93 FC 20 53 E4 A5 F7 45 02 05 90 F0 03 4C E2 FC A5 31 F0 03 4C B9 02 A5 32 F0 03 6C 2F 00 20 33 A5 A2 03 86 C6 BD F3 02 9D 76 02 CA D0 F7 4C E9 02 A9 07 85 F8 20 D4 02 26 F7 EE 20 D0 C6 F8 10 F4 A5 F7 60 00 00	This is the machine code of the program to execute. We will translate this back to assembly so we can understand what it does later.
Checksum	E4	I don't know how is this calculated?

Figure 2.9: The meaning of the data we've read in so far.

This small program, once we have loaded the rest of it, is where the fun starts. But before we do that we have lots more busywork to do. How about reading in all of the

above data again from the tape? Yup, that's correct. As we keep reading the tape we will find that it contains all of the above data a second time, with the slight difference that the 'Data Block Header' will be 09 08 07 06 05 04 03 02 01 instead of 89 88 87 86 85 84 83 82 81.

We have to read another 23,000 or so more pulses before we get to something new that we're interested in, the second and final part of the program that we can execute.

When it arrives it looks like this:

89	88	87	86	85	84	83	82	81	A9	80	05	91	4C	EF	F6
A9	A7	78	8D	28	03	A9	02	8D	29	03	58	A0	00	84	C6

Checksum	53	I stil don't know how is this calculated!

Figure 2.11: The meaning of the second batch of data we've read in.

Would you be surprised to learn that we have to read in this payload a second time from the tape before we're done? Let's just assume that you're not and let's move swiftly on to wondering what we're supposed to do with 100 or so bytes of data we've finally managed to read after listening to some 50,000 chirrups and clicks from cassette tape.

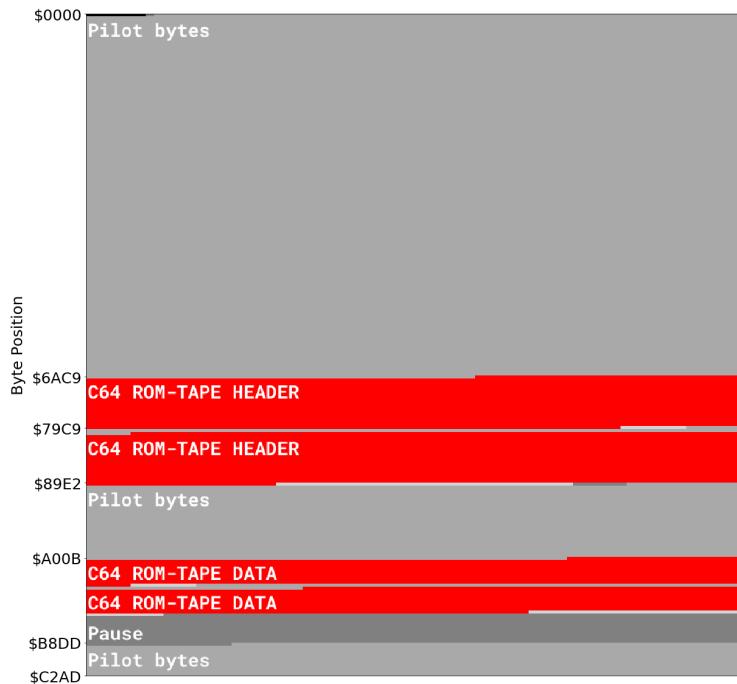

Figure 2.12: The bytes we've read so far from the tape.

The answer is simple. We load the data we've received into RAM and execute it. We load the second chunk of data we received at address \$02A7 (this was given in the 'Load Address' field) and the first chunk of data we received directly after it.

What is this program? It seems a bit short to be Iridis Alpha right? What it is is a whole new program for reading the rest of the data from the tape. That's right: we've read all this data from the tape to get a program for reading data from the tape. This type of program is called a 'loader', or perhaps in an effort to justify its existence, a 'turbo loader'.

2.3 A Loader for your Loader

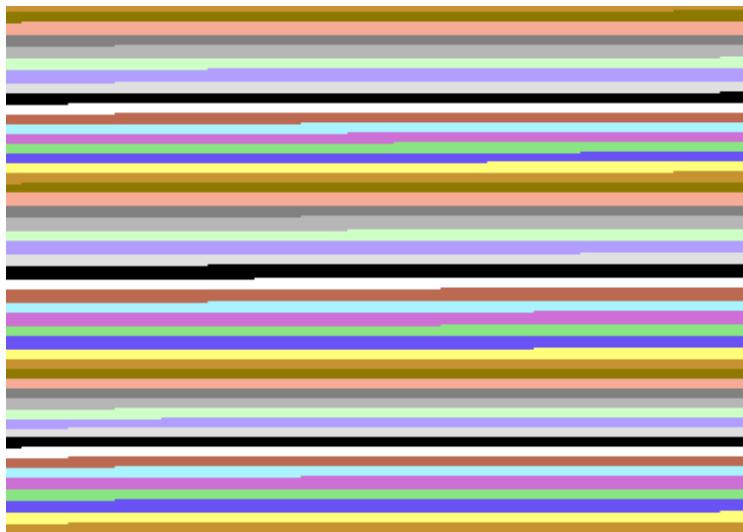

Figure 2.13: MegaSave loader pictured.

The idea is that this little program will do a better job of reading data from the tape and do it more quickly than the C64 can manage by itself. There is a whole menagerie of these programs that proliferated in the 1980s with exotic names such as Jetload, Easytape, Audiogenic and so on. Luigi di Fraia maintains a utility called `tapclean` that does a great job of identifying and emulating these loaders and thanks to him we have a disassembled version of the loader we've just found on the Iridis Alpha tape. It has the quintessentially 1980s moniker 'MegaSave' and as you can see in the listing reproduced on the next page it is relatively compact.

Now before you turn the page, bear in mind that you are not expected to read or understand this listing yet. I've reproduced it here so you can get a sense of what a small assembly program looks like. If you're going to read your first serious piece of assembly this is not where you should start. If anything else, the font is way too small!

```

What does MegaSave do that makes it so much faster than the default C64 tape loader? The simple answer is that it cuts corners and strips away all of the cautious redundancy we observed when loading the loader itself. Instead of reading 20 bytes (or pulses) from the tape in order to construct a single byte it just needs 8. It does what we naively thought at the beginning might be the way to read data from the tape: a long pulse is a 0, a short pulse is a 1, you read 8 of them you have the 8 bits for your byte.

This simplicity is risky. With no repetition of data blocks, no parity check on each individual byte, and no delimiters between bytes, the loader is vulnerable to corruption of the tape itself or any hardware flakiness in the cassette reader. The fact that it generally works is simply due to a lack of conservatism paying off in practice. In addition, the MegaSave loader isn't totally bereft of precautions. There is a slightly elaborate

dance it goes through to gain some assurance that the tape medium is going to yield a reliable string of bytes.

The first thing it does is look for a sentinel value of \$63.

The First Pilot Byte of '63' as read by the loader from the tape.

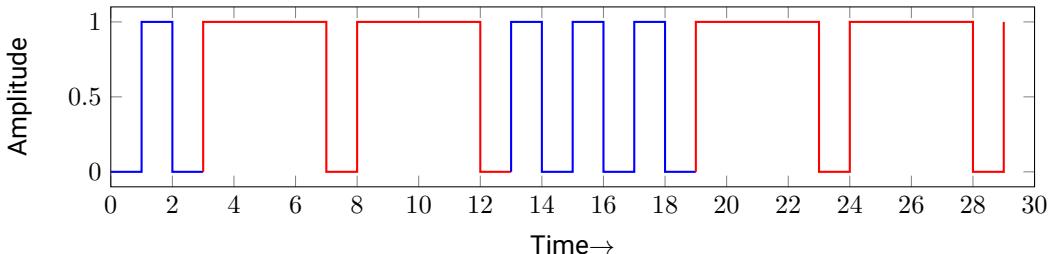

Figure 2.14: Long square waves in red represent pulses giving a '1' bit, Short square waves in blue represent a '0' bit. So this gives us '01100011' i.e. \$63. Unlike the default tape loader, MegaSave expects the 'most significant bit first' - which is the natural way of representing bits on paper so we don't need to reverse the bits to 'make sense' of them.

There is an inordinately long string of these, followed by an ascending sequence of byte values from \$63 to \$FF. The long series of \$63s are known as 'Pilot Bytes'.

63	63	63	63	63	63	63	63	63	63	63	63	63	63	63	63	63	63
63	63	63	63	63	63	63	63	63	63	63	63	63	63	63	63	63	63
63	63	63	63	63	63	63	63	63	63	63	63	63	63	63	63	63	63

Figure 2.15: The leading material read by the Megasave loader in the run up to retrieving game data. The Pilot Bytes are in red, the beginning of the 'Sync Train' in blue.

Following the pilot bytes we get an ascending series from \$63 to \$FF. This sequence

has the catchy name of a 'Sync Train'. Once the Sync Train has reached \$FF the decoder knows that its time to start taking some of this data seriously:

63	63	63	63	63	64	64	65	66	67	68	69	6A	6B	6C	6D	6E
6F	70	71	72	73	74	75	76	77	78	79	7A	7B	7C	7D	7E	7F

02	CA	00														

Figure 2.16: The rest of the leading material read by the Megasave loader in the run up to retrieving game data. The last few Pilot Bytes are in red, the 'Sync Train' in blue, and the Data Header fields from the grey cell onwards.

The bytes after the blue cells above are our first bit of raw meat in a while. Here's what they mean:

Field Description	Field Value	Note
Header Sentinel	01	Indicates the start of the header, expected to be non zero.
Load Address	00 08	Address to load to: \$0800
End Address	FF BF	End Address to load to: \$BFFF
Execution Address	00 00	Filename: "IRIDIS"
Next Action Indicator	01	Resume loading data when done or execute the loaded data.
Execution Type	02	How to execute the code.

Figure 2.17: The meaning of the Data Header values read in by MegaSave.

What the loader can garner from this is that the data that follows should be read in and stored at \$0800 and that rather than execute it straight away it should then resume loading more data from the tape.

The entire game is stored across four separate chunks on the tape. Once it has loaded this first one, the loader reads in the next three chunks.

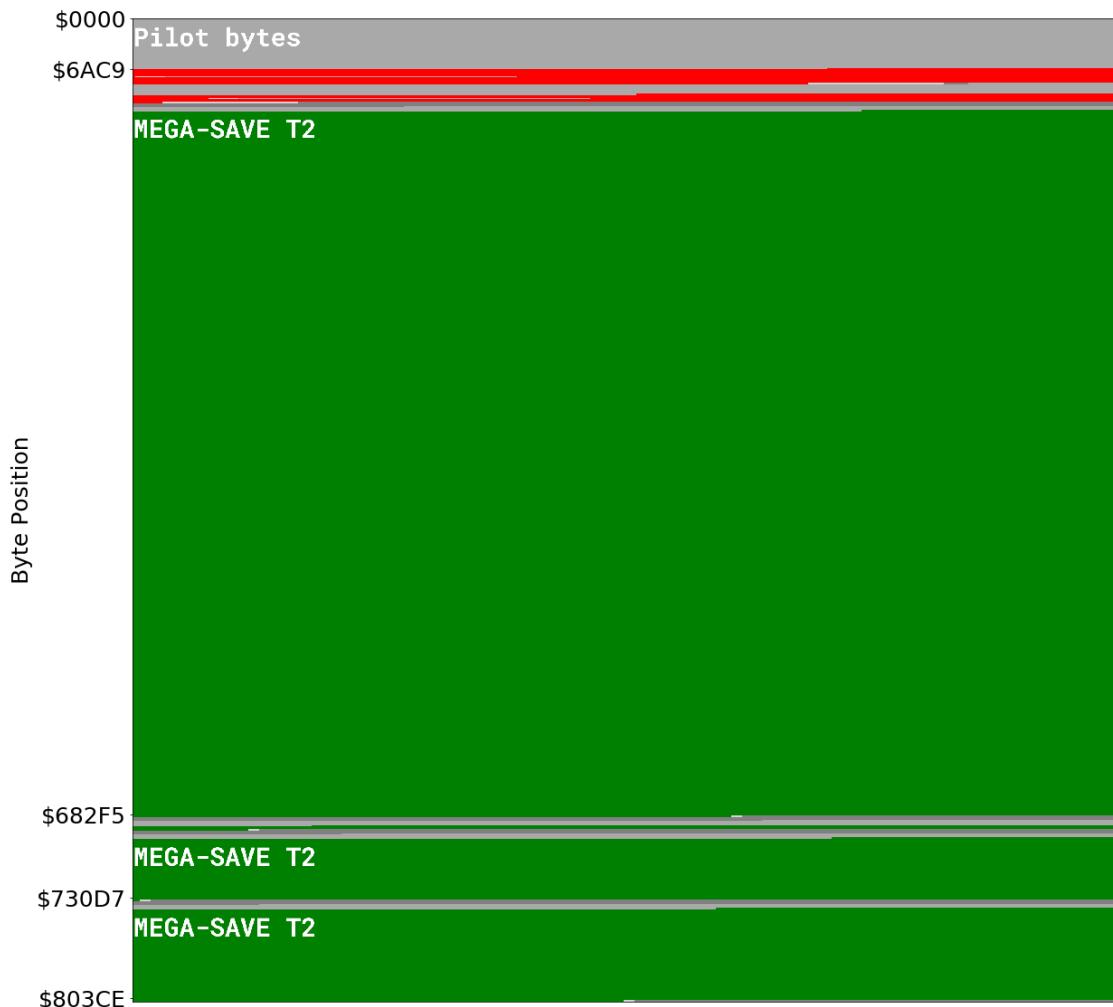

Figure 2.18: All the data that has been read from the tape. The four chunks of game data are in green the second is only a sliver visible below the label \$682F5. The relative sizes of the red data (the MegaSave loader which is only actually 200 or so bytes long) and the green data (representing over 50,000 bytes of game data) illustrate how efficient the MegaSave loader's storage is by comparison with the default.

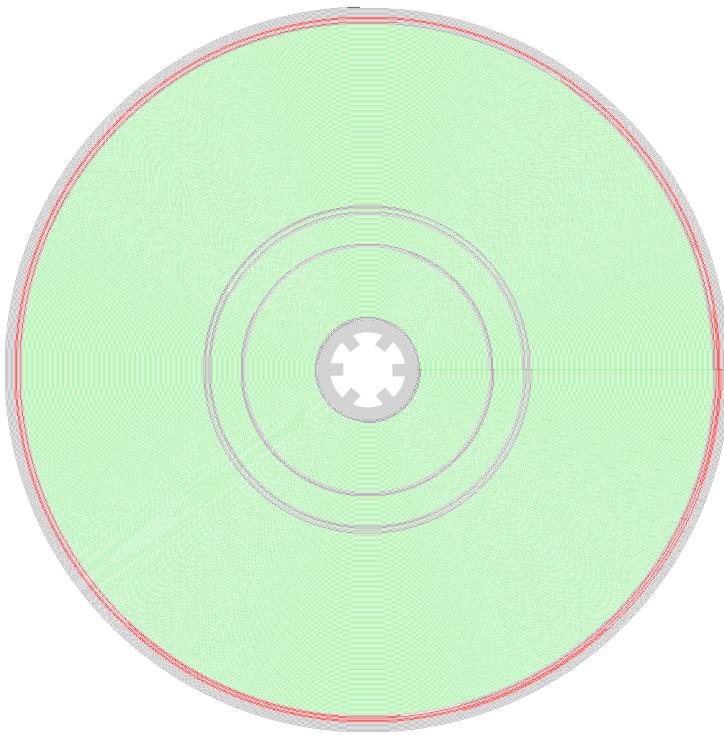

Figure 2.19: Our image of the spool from the start of this chapter but this time with each section colored in as described in the previous image.

When it has finished it has loaded each of the four chunks to the following positions in RAM:

Start Address	End Address	Note
0800	BFFE	The game starts at \$0800 in RAM.
BF00	BFFF	Note this will overwrite the last 255 bytes written above.
C000	CFE	Third chunk written right up to the start of System ROM at D000.
E000	F7FF	The rest of our data written after System ROM.

Figure 2.20: The four chunks of game data.

To give you an idea of where the different parts of the game end up in the computer's memory let's take a look at where everything goes using the chart below:

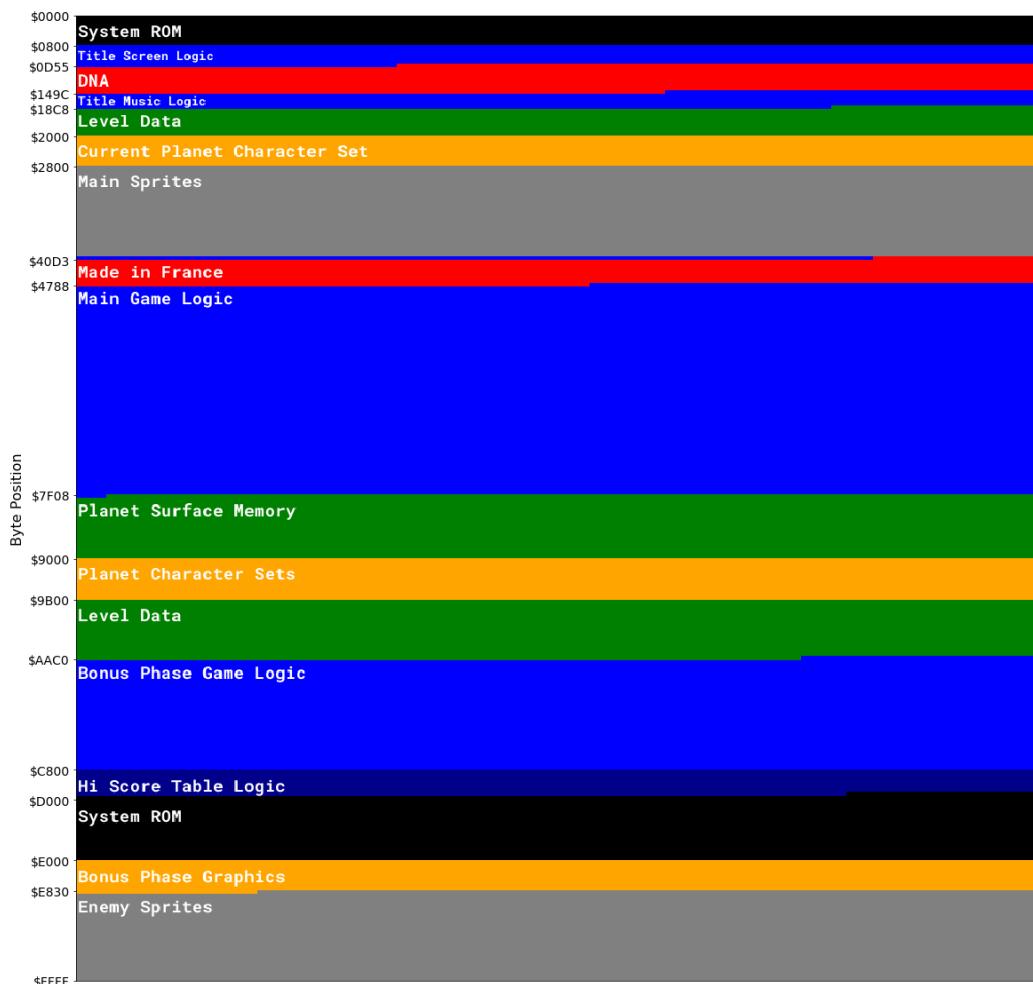

Figure 2.21: Where the different parts of the game end up in memory. Note the sections of 'System ROM' in black. The loader had to avoid copying to these as they are where the C64's operating system lives.

2.4 Putting an End to the Madness

With all the data read and loaded to the C64's RAM you might wonder how the loader knows what to do next (i.e. to run the game) and how it will know where to start running it from. The answer is given in the `Header Data` for the final chunk of data:

Field Description	Field Value	Note
Header Sentinel	01	Indicates the start of the header, expected to be non zero.
Load Address	00 E00	Address to load to: \$E000
End Address	00 F80	End Address to load to: \$F800
Execution Address	10 08	Address to start execution at: \$0810.
Next Action Indicator	00	00 means start executing code, don't read any more data.
Execution Type	02	How to execute the code: 01 means used the address given in 'Execution Address'.

Figure 2.22: The meaning of the Data Header values in the final chunk of data read in by MegaSave.

So according to the header data, the loader should stop reading data now and start executing what has already been loaded, and it should start doing this at address \$0810. When we look at the code that has been loaded to address \$0810, this is what we find:

```
*=$0810
StartExecution
    SEI
    ; Tell the C64 to execute the code at MainControlLoop
    ; the next time an interrupt happens.
    LDA #>MainControlLoop
    STA $0319      ;NMI
    LDA #<MainControlLoop
    STA $0318      ;NMI

    ; Turn off the tape deck.
    LDA #$10
    STA $DD04      ;CIA2: Timer A: Low-Byte
    LDA #$00
    STA $DD05      ;CIA2: Timer A: High-Byte
    LDA #$7F
    STA $DD0D      ;CIA2: CIA Interrupt Control Register
    LDA #$81
    STA $DD0D      ;CIA2: CIA Interrupt Control Register
    LDA #$19
    STA $DD0E      ;CIA2: CIA Control Register A
    CLI
LoopUntilExexcutes
    JMP LoopUntilExexcutes
```

Listing 2.2: The first piece of code that is executed in Iridis Alpha.

This routine does two things: it turns off the tape deck and tells the C64 to execute the code at a different location (MainControlLoop) the next time that it wakes up and wonders what to do. Until then it goes into a loop executing LoopUntilExexcutes over and over again.

The C64 isn't getting out of bed and pondering its future over coffee once a day like

the rest of us. It wakes up hundreds of times every second wondering what it should do next, in a permanent state of fizzing attention. So in a few microseconds time it will inspect the address we stored at \$0318 above, immediately go there, and do whatever it is told. What it will be told is contained in MainControlLoop, and with that Iridis Alpha will at last get underway.

I've built you up nicely to expect that we will finally get down to business and see how pixels are thrown on the screen, haven't I? Please console yourself with the picture below before proceeding circumspectly to the next chapter.

Figure 2.23: A prg is born.

Some Disassembly Required

We've reached the point where the game has started to execute. We just saw a snippet of code that turned off the tape recorder and prompted the C64 to run a routine called `MainControlLoop`. Though perhaps a little cryptic, and you shouldn't expect to understand it yet, this code is not exactly what the machine 'saw'. Instead it read and executed something far more puzzling-looking:

```
78A9 408D 1903 A900 8D18 03A9 108D 04DD A900 8D05  
DDA9 7F8D ODDD A981 8D0D DDA9 198D 0EDD 584C 3508
```

Listing 3.1: The first piece of machine code that is executed in Iridis Alpha.

That's right it executed a stream of bytes. A stream of bytes commonly referred to as *machine code*. Each of these bytes is meaningful to the C64 whether individually, or taken in pairs, or even in groups of three. It can comprehend them as instructions to carry out that will shuffle data around in its memory and ultimately result in a game that can be played.

Before we can dig into the internals of how Iridis Alpha works we have to convert all of the machine code we've loaded into memory in the previous chapter into something we have a chance of reading and understanding. This process is called *disassembly* and here we're going to explain how it is done and along the way gain a little basic understanding of the human-readable language, called '*6502 Assembly Language*', that we convert the machine code back into.

The process is called *disassembly* simply because it is the exact reverse of the process that was originally followed to generate the data on the tape from the assembly language written by Jeff Minter in the first place. Programs that do this are referred to as '*assemblers*'. They assemble the instructions written by the programmer into machine code that the C64 can execute. As self-appointed disassemblers we are going

to turn it back into assembly language.

Jeffrey Says

According to Jeff Minter's development diary, Iridis Alpha was programmed and "assembled on a C128 using a partially-finished JCL assembler and the horrible, slow Commodore disk drives." You've read that correctly: Iridis Alpha was not written on a C64 but its more powerful and expensive, and hence much less popular, successor the C128.

Figure 3.1: The 1984 JCL Assembler on the C128. You can imagine how user-friendly this thing must have been.

This wasn't so uncommon back in the day: computers like the C64 were not powerful enough for getting any actual work done (such as writing and assembling a game), so the programming and assembling was done on more capable, but often prohibitively expensive, microcomputers. As long as the assembler was configured to output a file that could be run on the C64, actual development could be done on any system the developer found tolerable. Or as Minter put it: "Next time I'm gonna use a 6502 X-ASM running in 2.5 Megabytes of RAM on me trusty [Atari] ST..."

Along the way we will have to invent names for things that are meaningful to us: the names Jeff Minter gave to his functions, routines, and variables are long since lost to us. They were thrown away by the assembler as unnecessary for execution of the machine code. As we proceed, we will see why but it hopefully makes sense to say that the 6502 CPU in the C64 doesn't care what things are called, it just cares where in the 65,632 bytes of its RAM things are located. That is to say it only cares about their 'address'.

So let's start by stepping back for a second. Let's put the machine code and the snippet of code we disassembled it back into and see what we can learn:

```
78
A9 40
8D 19 03
A9 00
8D 18 03
A9 10
8D 04 DD
A9 00
8D 05 DD
A9 7F
8D 0D DD
A9 81
8D 0D DD
A9 19
8D 0E DD
58
4C 35 08
```

Listing 3.2: Machine Code

```

JMP $0835
```

Listing 3.3: Assembly Language

Straightaway we can infer meanings to some of the bytes:

Byte	Instruction
78	SEI
A9	LDA
8D	STA
58	CLI
4C	JMP

Figure 3.2: Machine code bytes and their assembly language counterparts.

Let's quickly explain what two of these mean as they're extremely common and also fundamental to machine code programming in general.

LDA loads the byte you give it into a small one-byte slot called the 'Accumulator' ('A' for short, so LDA is an abbreviation for 'Load to Accumulator'). Think of this slot as a pocket - somewhere for the CPU to store a value for use later on. The technical name for this kind of slot/pocket is a 'register'. The 'Accumulator' is so-called because a lot of the operations performed on bytes stored in this particular pocket have very precise behaviour when addition operations are executed on it. But we never really have to worry about this too often and in the general case it is simply used, as here, as a place to put a value so we can do something else with it.

```
LDA #$40
```

Listing 3.4: Loading the byte \$40 to the Accumulator.

What we do with it for the most part in the code above is go on to store it somewhere else. This is where the STA instruction comes in. This stores the value in the 'Accumulator' pocket at the address in memory that you give to it. As we can see such addresses are not one byte long, but two bytes. Are they ever more than two bytes long? No, and for a very simple reason. The C64 can only understand addresses that are at most two bytes long and this is what ultimately limits it to 64KB of memory. The largest address it can understand is therefore \$FFFF - the largest value that can be expressed by 2 bytes. Which translates to 65,535. Including zero, this allows us 65,536 bytes, which is 64KB of RAM.

When we look at the disassembly of the STA instructions we see something quite puzzling:

```
8D 19 03
```

```
STA $0319
```

Shouldn't we have expected 8D 19 03 to translate to STA \$1903 rather than STA \$0319? Why are the numbers back to front like that? The reason is due to something you may have heard described with a word that you've never fully understood and maybe never dared to question. The machine code stores the address 0319 as 1903 because the 6502 CPU in the C64 expects to read addresses with the second half of the number first. When we read numbers we expect it to start with the most significant digits first, i.e. \$0319. But most computer architectures of the 1980s had the opposite expectation - reading the least significant digits first, or the least significant bits first since this is a computer we're talking about, i.e. \$1903. This approach possesses a couple of advantages, the main one being that the computer can start performing an operation on the number (e.g. addition) before it has read all of it. For example, if you're adding 5312 and 2043 you already have enough to get started with once you've read 12 and 43. The carrying etc. can all happen once you've read the rest of the two numbers. This approach is known as 'little-endian' byte ordering. The opposite, which is closer to what we are familiar with when reading numbers ourselves, is called 'big-endian'. If you had never heard of either of those terms before, then you have now.

The next incremental step in understanding our disassembly is to apply some meaning to these two-byte values that we've decoded. As it happens, all the ones given in this piece of code represent addresses in the C64's memory of \$FFFF bytes, or in the preferred parlance of we humans, 65,536 bytes. Each address here has a particular function so storing a value in it does something. Let's add the meanings, which are still a little cryptic, to our listing:

```

SEI
LDA #$40
STA $0319
LDA #$00
STA $0318
LDA #$10
STA $DD04
LDA #$00
STA $DD05

STA $DD0E ; CIA2: CIA Control Register A
CLI
JMP $0835 ; Jump to address $0835

```

Assembly Language with some comments

As you may remember we said in the previous chapter that this little routine is doing two things: the first is telling the C64 to jump to and execute the routine that starts the actual game the next time it 'wakes up'; the other thing it's doing is turning off the cassette tape reader so that no more data is read from the tape.

The bit that's turning off the tape reader is this:

```

LDA #$10
STA $DD04 ; CIA2: Timer A: Low-Byte
LDA #$00
STA $DD05 ; CIA2: Timer A: High-Byte
LDA #$7F
STA $DD0D ; CIA2: CIA Interrupt Control Register
LDA #$81
STA $DD0D ; CIA2: CIA Interrupt Control Register
LDA #$19
STA $DD0E ; CIA2: CIA Control Register A

```

We are better off treating this series of instructions as a magic formula. The operation of the tape reader is managed by the values stored in a series of bytes between \$DD04 and \$DD0F. The fact that we have to write a variety of values to 5 of them to just stop reading from the tape is just a testament to the power of boring overhead - we'll never interact with the tape reader again so studying the entrails here is not going to benefit us in any way.

The other thing this routine is doing - preparing the C64 to execute the game proper - is more compact and introduces two concepts that are going to be important throughout our tour of the Iridis Alpha code so it is worth spending some time on them here to get

them clear.

```
LDA #$40
STA $0319 ; Non-Maskable Interrupt
LDA #$00
STA $0318 ; Non-Maskable Interrupt
```

Listing 3.5: Containing two important concepts.

3.1 Important Concept Number One: High Bytes and Low Bytes

On the face of it these four instructions are doing something very simple. They are storing the value \$40 at address \$0319 and the value \$00 at \$0318. What they are actually doing is storing the address \$4000 in a place where the C64's 6502 CPU will be expected to look in a moment's time and take that as a command to start executing whatever is at address \$4000.

43	36	34	00	40	41	50	45
0315	0316	0317	0318	0319	031A	031B	031C

Figure 3.3: The slice of C64 memory between addresses \$0315 and \$031C and the bytes that live there after we've written \$40 to \$0319 and \$00 to \$0318.

The reversed order we spoke about earlier, the 'little-endian' order, in which the 6502 CPU stores and reads pairs of bytes is observed again here. When the CPU reads the contents of \$0318 and \$0319 it interprets them not as \$0040, which is the order in which they appear to us, but as \$4000.

When discussing this storage arrangement we refer to the contents of \$0318 as the 'Low Byte' and the contents of \$0319 as the 'High Byte'. 'High' is just another way of saying 'first', and 'Low' another way of saying 'second'. When talking about values like \$4000 stored in \$0318-\$0319 such as in this case \$40 is the 'High Byte' and \$00 is the 'Low Byte'.

Writing values to a pair of adjacent addresses in memory like this so that they can be subsequently interpreted as yet another address to get something from or do something with is a very common pattern in programming 6502 CPUs such as the C64's and we will encounter it a *lot* in this book.

It's a strange sort of indirection when you first attempt to understand it. Instead of storing actual values at an address, we're storing an *address* in the address. If you are familiar with other programming languages you may already recognize this concept and understand how powerful it can be. If you are not it will probably seem strange and maybe even wasteful. Seeing the many uses it is put to in the Iridis Alpha code may persuade you otherwise, but hopefully when we look at the use it is put to here you may begin to get a flavor of its utility. Let's do that by looking at our second important concept.

3.2 Important Concept Number Two: Interrupts

```
LDA #$40
STA $0319 ;Non-Maskable Interrupt
LDA #$00
STA $0318 ;Non-Maskable Interrupt
```

Listing 3.6: It's an interrupt. And it's non-maskable.

We previously waved away what's happening in this code by saying that the address \$4000 will be interpreted as an address to jump to and start executing the next time the 6502 CPU 'wakes up'. That's a lot of hand-waving.

The technical term for this 'waking up' is an 'interrupt'. This waking up happens incredibly frequently, 60 times every second. 60 times a second the C64 will stop what it's doing and execute whatever is given as an address by the bytes at \$0318–\$0319.

The number 60 may ring a bell for you in this context. A common aspiration for graphics-based games, and minimum table-stakes today, is that a game runs at 60 'frames per second'. In other words, that at least 60 times a second the display is updated and whatever is on the screen moves a little bit.

While a C64 programmer would never achieve 60 frames per second in practice, 'interrupts' are the C64's mechanism for at least getting some of the way there. They allow the game developer to at least do something to the display many times per second. Whatever it is, it has to be something short and sweet and at the same time effective enough to actually progress the gameplay. This is why this concept is important to us: most of the important things that happen in Iridis Alpha will be effected during an interrupt. When we look at moving, shooting, and blowing things up, all of them are going to happen in routines that are called multiple times per second by the 6502 CPU executing the code that has been stored at the address \$0318–\$0319 at that point in time.

And this is our first taste of the power of storing an address in an address. Depending

on where we are in the game - be it the title screen, the main game, the bonus phase, or in a pause mode sub-game, the code that we want to run during these interrupts will be different.

We can see this in action if we look at what happens when the code at \$4000 is executed. We've given this address \$4000 a 'label' name of `MainControlLoop` in our disassembled code so `MainControlLoop` always refers to whatever lives at \$4000.

```

MainControlLoop
    LDA #$00
    SEI
p4003  LDA #<MainControlLoopInterruptHandler
        STA $318      ; NMI
        LDA #>MainControlLoopInterruptHandler
        STA $319      ; NMI

```

Listing 3.7: The code at \$4000.

As you can see the first thing it does is change the address of the code that should be executed at every 'interrupt'. It's now an address referred to by the label `MainControlLoop-InterruptHandler`. This happens to be address \$6B3E but the beauty of using labels in our code is that we no longer need to worry about the number of the addresses anymore. The label will do the job for us. It does mean we have to know what the syntax `#<MainControlLoopInterruptHandler` means though. What it means is: if `MainControlLoopInterruptHandler` lives at \$6B3E the `#<` decorators refer to the \$3E part of the address, so we're actually saying `LDA #$3E`, i.e. load the value \$3E into the 'Accumulator'. Similarly the syntax `#>MainControlLoopInterruptHandler` refers to the \$6B part of the address.

43	36	34	3E	6B	41	50	45
0315	0316	0317	0318	0319	031A	031B	031C

Figure 3.4: The values in \$0318 and \$0319 after we've updated them in `MainControlLoop`.

We've almost squeezed as much as we can out of this short and boring snippet of code. There's just one last thing to point out that will be useful to us later. The last instruction in the routine:

```
JMP $0835
```

Listing 3.8: Jump.

This tells the CPU to jump to the address \$0835 and execute whatever is there. What

is at \$0835? This:

```
JMP $0835
```

Listing 3.9: Hello again.

That's right - it's jumping back to itself and will execute in an infinite loop repeatedly executing the instruction over and over again. The reason it does this is because it won't be doing it very long. The interrupt will take over and steal execution away so that the C64 can find better things to do than run in circles.

Before we move on let's take one last look at our disassembly accomplishment.

```
StartExecution
    SEI
    ; Tell the C64 to execute the code at MainControlLoop
    ; the next time an interrupt happens.
    LDA #>MainControlLoop
    STA $0319      ;NMI
    LDA #<MainControlLoop
    STA $0318      ;NMI

    ; Turn off the tape deck.
    LDA #$10

Listing 3.10: Fully disassembled

Hopefully with these basics under our belt we can begin to understand how the interesting parts of Iridis Alpha work.

The First 16 Milliseconds

OK, where were we? At the end of [A Little Archaeology](#) we were just about to get started and start the race to get something up on the screen. We had set up an interrupt to make us jump to `MainControlLoop` at address \$4000.

Our first act, which we covered briefly in the previous chapter, was to make sure that interrupt didn't have us jumping here again. So we overwrote the interrupt handler with a new address:

```
MainControlLoop
    LDA #$00
    SEI
p4003  LDA #<MainControlLoopInterruptHandler
        STA $318      ;NMI
        LDA #>MainControlLoopInterruptHandler
        STA $319      ;NMI
```

Listing 4.1: The code at \$4000.

Our next act is to call a routine to set up the main title screen:

```
; Display the title screen. We'll stay in here until the
; player presses fire or we time out and go into attract mode.
JSR EnterMainTitleScreen
```

Listing 4.2: In `MainControlLoop`

This brings us to a routine called `InitializeSpritesAndInterruptsForTitleScreen` in which we do some vital setup for the next 16 milliseconds and how we go about getting everything on the screen that we need to:

```

; Set up the our interrupt handler for the title
; screen. This will do all the animation and title
; music work.
LDA #<TitleScreenInterruptHandler
STA $0314      ;IRQ
LDA #>TitleScreenInterruptHandler
STA $0315      ;IRQ

; Acknowledge the interrupt, so the CPU knows that
; we have handled it.
LDA #$01
STA $D019      ;VIC Interrupt Request Register (IRR)
STA $D01A      ;VIC Interrupt Mask Register (IMR)

; Set up the raster interrupt to happen when the
; raster reaches the position we specify in D012.
LDA $D011      ;VIC Control Register 1
AND #$7F
STA $D011      ;VIC Control Register 1

; Set the position for triggering our interrupt.
LDA #$10
STA $D012      ;Raster Position

```

Listing 4.3: In InitializeSpritesAndInterruptsForTitleScreen

You'll notice we've changed yet another interrupt handler again, this time to a routine called TitleScreenInterruptHandler. The particular type of interrupt we're going to handle here is something called a 'Raster Interrupt'. A 'raster' can be thought of as a beam of light that scans across the screen from top to bottom and left to right painting each pixel on the screen one at a time. It travels so quickly down and across the screen painting pixels that it can do so up to 60 times a second. As it makes this journey our 'Raster Interrupt' gives us the opportunity to tell it to stop once it reaches a certain position on the screen and allows us to run some code before it resumes again. We can do this as many times as we want along the journey, but each time we interrupt it we have to be quick. If our code takes too long the display will flicker and the content of the screen become inconsistent.

In this routine we set our first interrupt to line 16 (\$10) on the screen:

```

; Set the position for triggering our interrupt.
LDA #$10
STA $D012      ;Raster Position

```

Listing 4.4: In InitializeSpritesAndInterruptsForTitleScreen

This facility is the key that will allow us to do all sorts of magic in the 16 milliseconds it takes to traverse the screen. Every time we get the opportunity to run some code thanks to this interrupt we'll change the location of the screen it should stop at the next

time so that we get to stop dozens of times in each single 16 millisecond traversal.

Before we look at how we fit it all in, let's first appreciate just how much we plan to do each time the screen is painted.

4.1 Sprites

The C64 makes 8 sprites available to us. A sprite is a special purpose graphical object that can be up to 24 pixels wide by 20 pixels high. We can place them wherever we want on the screen. They are the core of graphics programming and Iridis Alpha has dozens of them. But if the C64 only has 8 sprites, are we limited to displaying just 8 sprites at once on the screen? The simple answer is that thanks to *Raster Interrupts* we are not: when we run some code after receiving an interrupt we can place new sprites wherever we like in any position that the raster hasn't reached yet. This means our only effective limitation is the number of sprites we can place on a single line, which is eight.

If you look carefully at the title screen of Iridis Alpha you'll notice that it is actually split in two. The top half has the title in large letters and the bottom half has a rainbow of jumping gilbies. Each half uses seven sprites to display these assets.

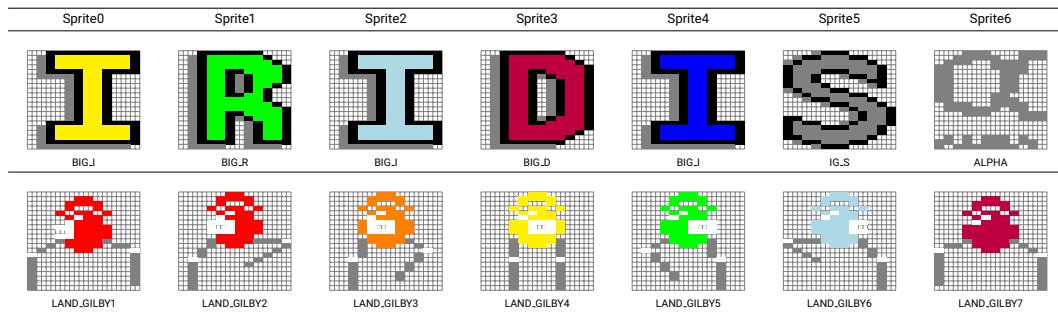

Figure 4.1: The sprites used by the top half of the screen and the bottom half of the screen.

The eighth sprite (Sprite 7) is used on both halves of the screen to display the starfield. This sprite pushes right up against the line limitation. It's painted at intervals throughout the screen but we're careful to avoid it ever being painted twice on the same line. We'll see how this is achieved very soon.

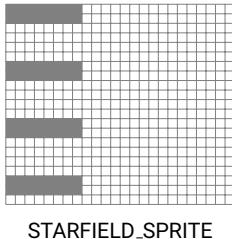

Figure 4.2: The sprite used for painting the starfield. Only a part of the sprite is ever painted!

4.2 Waiting for the Beam

With our 'Raster Interrupt' handler set up as `TitleScreenInterruptHandler` we're ready to react when the raster reaches line 16 on the screen. Since the screen is made up of 512 lines in total this will be along soon.

Before it comes in we just have time to prepare the relatively light amount of text we want displayed on the screen in memory. We only need to do this once. Throughout the code we refer to this area we write to as `SCREEN_RAM`. It's an address range between \$0400 and \$07E8 This is a very simple bitmap representation of the entire screen that is 40 characters wide and 25 characters high, giving a total of 1000 bytes (\$3E8 bytes in hex). If we wanted to think of it as pixels it is 320 pixels wide ($40 * 8$) and 200 pixels high ($25 * 8$). The important thing to remember about this `SCREEN_RAM` is that it is solely for storing what we call character data. You can think of character data as 'text'. This text gets painted first and then sprites get painted on top of it.

In `EnterTitleScreenLoop` we call two routines that will prepare the character data for the raster to paint.

The first, `DrawStripesBehindTitle` writes the rainbow stripes to five lines in the top half of the screen. The second, `DrawTitleScreenText` writes some text to the bottom half of the screen. Before we look at these in detail we need to understand how this thing `SCREEN_RAM` works and how we store characters for display in it.

Our starting point for displaying text on screen is to define what our characters look like. We define the appearance of a character using 8 bytes. This is what the definition of the stripe character looks like:

```

charactersetData
.BYTE $FF,          ; 11111111  *****
.BYTE $00,          ; 00000000
.BYTE $FF,          ; 11111111  *****
.BYTE $00,          ; 00000000
.BYTE $00,          ; 00000000
.BYTE $FF,          ; 11111111  *****
.BYTE $00,          ; 00000000
.BYTE $FF,          ; 11111111  *****

```

Listing 4.5: The 'stripe' character.

As you can see each byte translates to a row of 0s and 1s. Each 1 defines a dot and each 0 a blank space. We end up with a character that is 8 pixels wide and 8 pixels high:

1	1	1	1	1	1	1	1
0	0	0	0	0	0	0	0
1	1	1	1	1	1	1	1
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
1	1	1	1	1	1	1	1
0	0	0	0	0	0	0	0
1	1	1	1	1	1	1	1

The stripe character

We create this definition for every character we want to display and store it at the address starting at \$2000 in RAM. The order in which we store them determines the reference we use for them later. So for example the stripe character is referred to as \$00, the 'A' character we've defined as \$01 and so on:

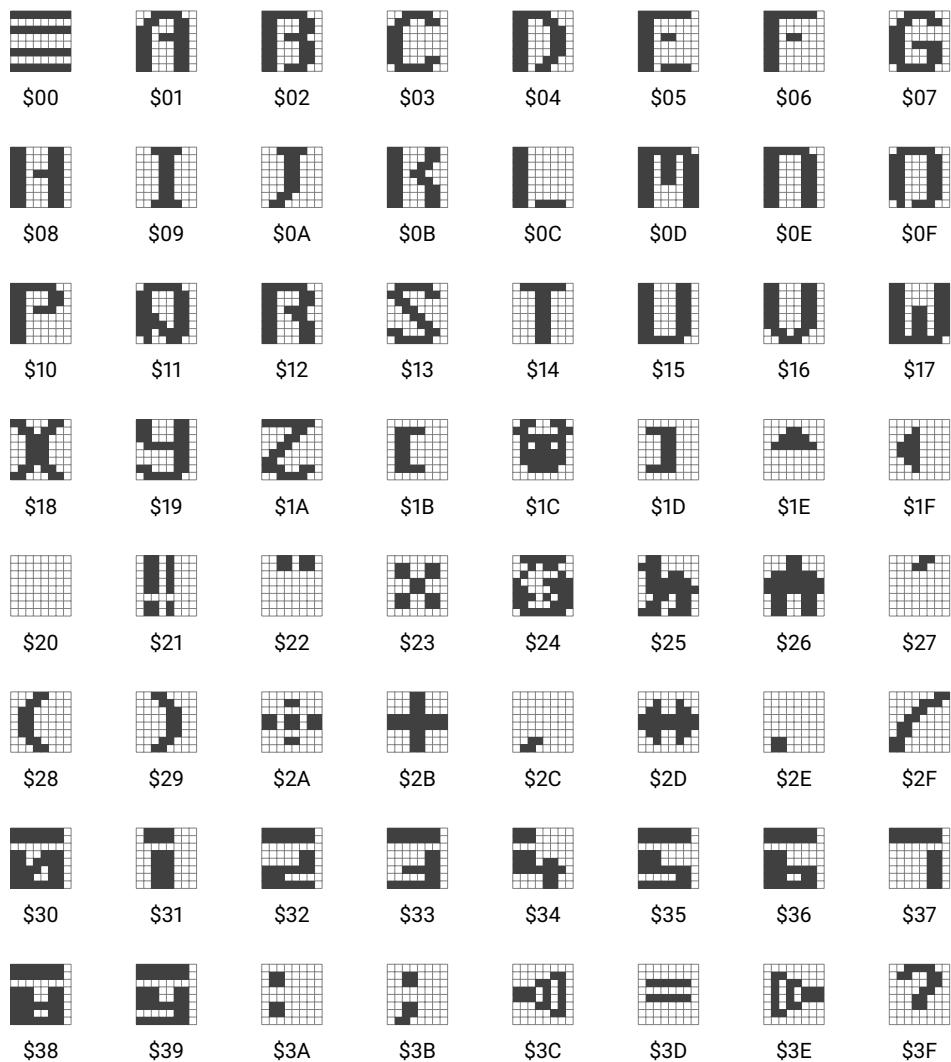

Figure 4.3: Tilesheet: Font Character Set stored at \$2000

With our character set defined we can now write some text to the screen ram. Note that when we write it to SCREEN_RAM we're not yet writing it to the actual screen. This is just a place in memory that the raster (our beam of light) will refer to later when it is actually writing dots to the screen. If we write a stripe character to a particular position in this SCREEN_RAM memory it will know to write it the corresponding position

on the screen.

4.2.1 Drawing the Stripes

So let's write some stripes to RAM!

```

DrawStripesBehindTitle
    LDX #$28
    LDA #$00
    STA shouldUpdateTitleScreenColors
DrawStripesLoop
    LDA #RED
    STA COLOR_RAM + LINE2_COL39,X
    LDA #ORANGE
    STA COLOR_RAM + LINE3_COL39,X
    LDA #YELLOW
    STA COLOR_RAM + LINE4_COL39,X
    LDA #GREEN
    STA COLOR_RAM + LINE5_COL39,X
    LDA #LTBLUE
    STA COLOR_RAM + LINE6_COL39,X
    LDA #PURPLE
    STA COLOR_RAM + LINE7_COL39,X
    LDA #BLUE
    STA COLOR_RAM + LINE8_COL39,X
    LDA #$00 ; Stripe character
    STA SCREEN_RAM + LINE2_COL39,X
    STA SCREEN_RAM + LINE3_COL39,X
    STA SCREEN_RAM + LINE4_COL39,X
    STA SCREEN_RAM + LINE5_COL39,X
    STA SCREEN_RAM + LINE6_COL39,X
    STA SCREEN_RAM + LINE7_COL39,X
    STA SCREEN_RAM + LINE8_COL39,X
    DEX
    BNE DrawStripesLoop

```

Listing 4.6: Drawing stripes using a loop!

As you can hopefully see, what we're dealing with here is a loop. We load X with the value \$28 (40 in decimal) and perform everything inside `DrawStripesLoop` until `DEX` has reduced the value of X to zero.

The magic number 40 gives us a clue that what we are doing in each loop is drawing a character in each column of the screen: remember that our screen is 40 columns wide and 25 rows high. The bit actually writing the stripe character to RAM is:

```

LDA #$00 ; Stripe character
STA SCREEN_RAM + LINE2_COL39,X
STA SCREEN_RAM + LINE3_COL39,X

```

```

STA SCREEN_RAM + LINE4_COL39,X
STA SCREEN_RAM + LINE5_COL39,X
STA SCREEN_RAM + LINE6_COL39,X
STA SCREEN_RAM + LINE7_COL39,X
STA SCREEN_RAM + LINE8_COL39,X

```

Listing 4.7: In DrawStripesBehindTitle

For the current column, this writes the stripe character (referenced by \$00 as we mentioned above) to each of lines 2 to 8. The use of the X in the STA statement is an offset. So where X is 14, for example, it will write to the position referred to by SCREEN_RAM + LINE2_COL39 plus 14.

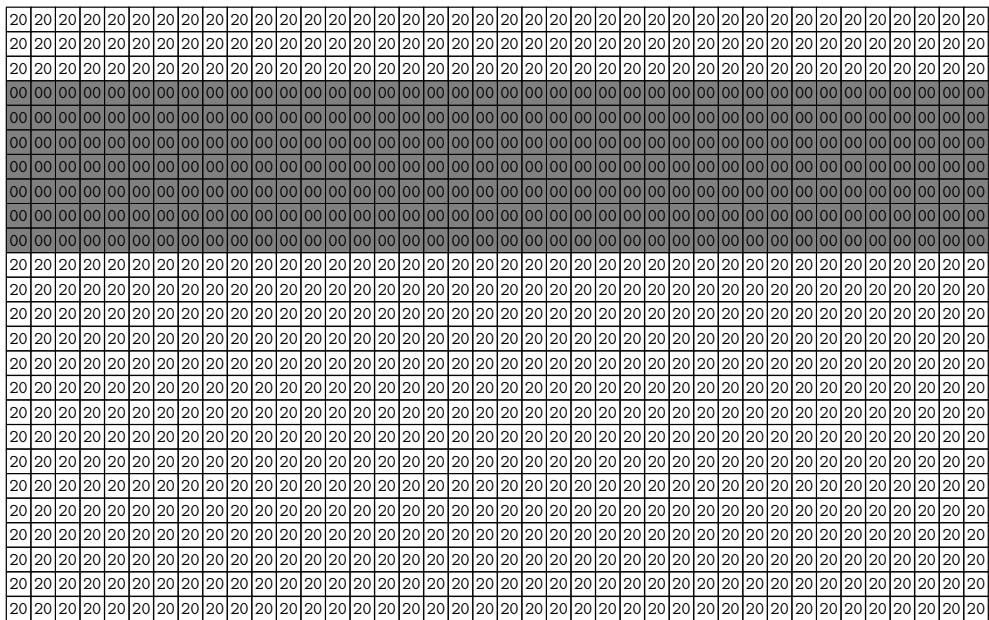

Figure 4.4: The shaded areas of SCREEN_RAM after they have been written to by DrawStripesBehindTitle.

The other thing we do in `DrawStripesLoop` is set the colors of the stripes. This is achieved using a region of memory similar in concept to SCREEN_RAM, that we call COLOR_RAM. This lives at \$D800 - \$DBFE and is another region of 1000 bytes, each one controlling the color of the character placed at a position in the 40 * 25 character rectangle of our screen.

```

LDA #RED
STA COLOR_RAM + LINE2_COL39,X
LDA #ORANGE

```

```
STA COLOR_RAM + LINE3_COL39,X  
LDA #YELLOW  
STA COLOR_RAM + LINE4_COL39,X  
LDA #GREEN  
STA COLOR_RAM + LINE5_COL39,X  
LDA #LTBLUE  
STA COLOR_RAM + LINE6_COL39,X  
LDA #PURPLE  
STA COLOR_RAM + LINE7_COL39,X  
LDA #BLUE  
STA COLOR_RAM + LINE8_COL39,X
```

Listing 4.8: In DrawStripesBehindTitle

We've used a meaningful alias for each of the color values that we write, these are defined as:

RED	= \$02
PURPLE	= \$04
GREEN	= \$05
BLUE	= \$06
YELLOW	= \$07
ORANGE	= \$08
BROWN	= \$09
LTBLUE	= \$0E

So by writing a value to the corresponding place in COLOR_RAM, we're defining the color of the character in that position.

Figure 4.5: The shaded areas of COLOR_RAM after they have been written to by DrawStripesBehindTitle.

4.2.2 Drawing the Text

Next up is to write out the title screen's text to SCREEN_RAM. This we do in `DrawTitleScreenText` using a similar loop to `DrawStripesBehindTitle`.

```
DrawTitleTextLoop
    LDA titleScreenTextLine1 - $01,X
    AND #ASCII_BITMASK
    STA SCREEN_RAM + LINE11_COL39,X
    LDA titleScreenTextLine2 - $01,X
    AND #ASCII_BITMASK
    STA SCREEN_RAM + LINE13_COL39,X
    LDA titleScreenTextLine3 - $01,X
    AND #ASCII_BITMASK
    STA SCREEN_RAM + LINE15_COL39,X
    LDA titleScreenTextLine4 - $01,X
    AND #ASCII_BITMASK
    STA SCREEN_RAM + LINE17_COL39,X
    LDA titleScreenTextLine5 - $01,X
    AND #ASCII_BITMASK
    STA SCREEN_RAM + LINE19_COL39,X

    LDA #GRAY2
```

```

STA COLOR_RAM + LINE11_COL39,X
STA COLOR_RAM + LINE13_COL39,X
STA COLOR_RAM + LINE15_COL39,X
STA COLOR_RAM + LINE17_COL39,X
STA COLOR_RAM + LINE19_COL39,X
DEX
BNE DrawTitleTextLoop

```

Listing 4.9: In DrawTitleScreenText

In this case we're not writing a single character over and over, rather we're writing text we've defined elsewhere in variables titleScreenTextLine[1-5]:

```

titleScreenTextLine1    .TEXT "IRIDIS ALPHA..... HARD AND FAST ZAPPING"
titleScreenTextLine2    .TEXT "PRESS FIRE TO BEGIN PLAY.. ONCE STARTED,"
titleScreenTextLine3    .TEXT "F1 FOR PAUSE MODE      Q TO QUIT THE GAME"
titleScreenTextLine4    .TEXT "CREATED BY JEFF MINTER...SPACE EASY/HARD"
titleScreenTextLine5    .TEXT "LAST GILBY HIT 0000000; MODE IS NOW EASY"

```

Listing 4.10: In DrawTitleScreenText

In each iteration of the loop we write a character to all five columns, plucking it from the position in titleScreenTextLine[1-5] given by X.

Figure 4.6: The shaded areas of SCREEN_RAM after they have been written to by DrawStripesBehindTitle and DrawTitleScreenText.

While writing text for the column we also set the color for each of the text lines to grey:

```
LDA #GRAY2
STA COLOR_RAM + LINE11_COL39,X
STA COLOR_RAM + LINE13_COL39,X
STA COLOR_RAM + LINE15_COL39,X
STA COLOR_RAM + LINE17_COL39,X
STA COLOR_RAM + LINE19_COL39,X
```

Listing 4.11: In DrawTitleScreenText

Once it is done the COLOR_RAM has the appropriate lines set to grey, in addition to the coloured stripes we added earlier:

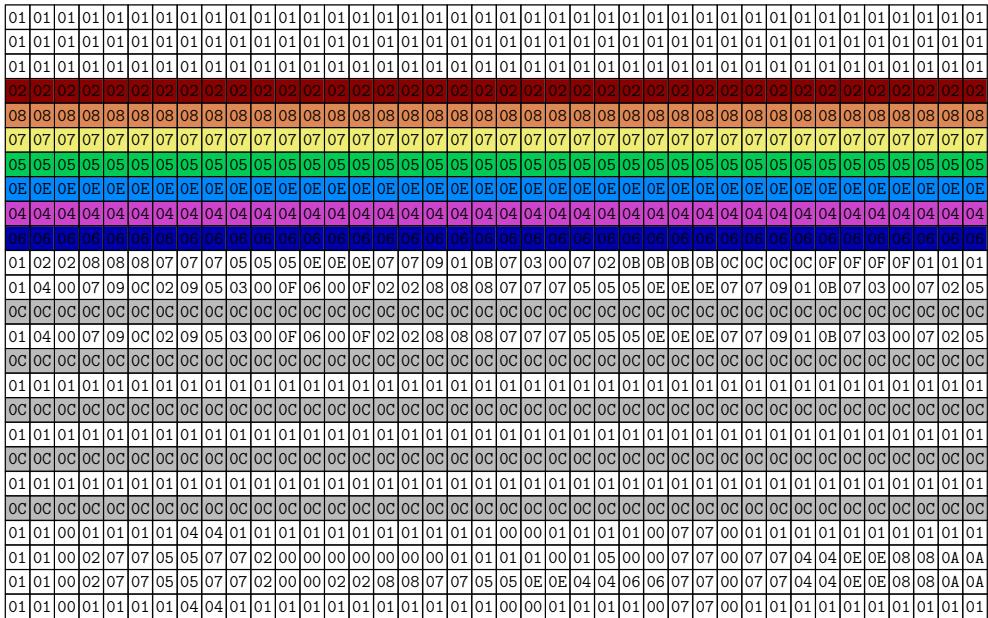

Figure 4.7: The shaded areas of SCREEN_RAM after they have been written to by DrawStripesBehindTitle and DrawTitleScreenText.

Now that we've looped through all 40 columns we have both SCREEN_RAM and COLOR_RAM fully prepared for painting by the raster. As we watch the screen getting painted in the next section we'll see the following picture we've prepared gradually appear - with the sprites painted on top of course. The magic of adding the sprites to this picture, and animating them while we're at it, is what we will unpick as follow the raster on its journey to the bottom of the screen in the next few milliseconds.

Figure 4.8: The screen as it would appear after `DrawStripesBehindTitle` and `DrawTitleScreenText` have run. The added grid helps compare with our previous figures for `SCREEN_RAM` and `COLOR_RAM`.

4.3 Racing the Beam

Now we're ready to receive our first beam. You may remember we set this to happen when the raster reached line 16:

```
; Set the position for triggering our interrupt.
LDA #$10
STA $D012 ;Raster Position
```

Listing 4.12: In `InitializeSpritesAndInterruptsForTitleScreen`

And that the routine we'll run when that happens is `TitleScreenInterruptHandler` (which itself will pass the work onto `TitleScreenAnimation`):

```
; Set up the our interrupt handler for the title
; screen. This will do all the animation and title
; music work.
LDA #<TitleScreenInterruptHandler
STA $0314 ;IRQ
LDA #>TitleScreenInterruptHandler
```

```
STA $0315 ; IRQ
```

Listing 4.13: In InitializeSpritesAndInterruptsForTitleScreen

The painting of sprites and playing of music as the screen gets painted is all handled by `TitleScreenAnimation`. This routine works by calling one of three different subroutines each time it's called. It picks the one to run depending on some internal state it maintains, all with a view to ensuring that the sprites spelling out the game's title and the sprites depicting the animated gilbies are updated and in place before the raster reaches them.

To ensure it gets called by the interrupt when its needed it will repeatedly update the line that the next interrupt should happen. We'll trace this as it actually happens, interrupt by interrupt, and sift through what the routine does at each step during the raster's first pass at painting the entire screen.

The first time the raster is called, this is what the screen looks like:

DoStarfieldAnimation (127 Cycles)

Figure 4.9: The state of the screen the first time the raster interrupt is received at line 16.

Of course we never actually see the screen in this state because it only appears for a microsecond or two, much too fast for us to observe. But as you can see the painting has already started. Everything above line 17 indicated in the figure has been painted black, as per our preparation of `SCREEN_RAM` a little earlier.

What our diagram above also tells us is that in this visit from the beam `TitleScreenAnimation` chose to execute the sub-routine `DoStarfieldAnimation` and that it took

127 CPU cycles to complete it. Since it takes the raster 63 cycles to do an entire line this means that by the time we've finished this piece of work, the raster will have moved on to the next line - which is why the diagram shows 17 rather than 16. Every time we get an interrupt, the raster doesn't wait for us. We have to work quickly, especially if we're preparing graphics on lines that it's likely to reach soon. This is why each of these subroutines does as little as it can get away with in order to get the job done.

There are three sub-routines the work at each raster interrupt can get divvied out to. These are `UpdateJumpingGilbyPositionsAndColors`, `DoStarfieldAnimation`, and a cluster of routines starting with `UpdateTitleScreenSpriteColors`. The one that's called the most often is `DoStarfieldAnimation` as it is responsible for sprinkling the screen with animated stars traversing left to right.

```

; -----
; TitleScreenAnimation
; This handles all the activity in the title screen and is called
; roughly 60 times a second by the Raster Interrupt.
; -----
TitleScreenAnimation
    LDY titleScreenStarFieldAnimationCounter
    CPY #$0C
    BNE MaybeDoStarFieldOrTitleText

    JSR UpdateJumpingGilbyPositionsAndColors
    LDY #$10
    STY titleScreenStarFieldAnimationCounter

MaybeDoStarFieldOrTitleText
    LDA titleScreenStarFieldYPosArray,Y
    BNE DoStarfieldAnimation

PaintTitleTextSprites
    JSR TitleScreenMutateStarfieldAnimationData

    LDA #$00
    STA titleScreenStarFieldAnimationCounter

    LDA #$10
    STA $D012      ;Raster Position

    ; Acknowledge the interrupt, so the CPU knows that
    ; we have handled it.
    LDA #$01
    STA $D019      ;VIC Interrupt Request Register (IRR)
    STA $D01A      ;VIC Interrupt Mask Register (IMR)

    JSR UpdateTitleTextSprites
    JSR MaybeUpdateSpriteColors
    JSR RecalculateJumpingGilbyPositions
    JSR PlayTitleScreenMusic
    JMP ReEnterInterrupt

```

```
; We're done, returns from function.
```

Listing 4.14: TitleScreenAnimation responsible for choosing what to do at each interrupt.

The internal accounting responsible for choosing the routine to run is tricky to decipher by just looking at the code. So instead let's follow what actually happens in practice. If we roll ahead to the next interrupt we can already see something happening:

DoStarfieldAnimation (99 Cycles)

Figure 4.10: The start of the stripes and a star.

If you look closely, you can see a yellow star painted over the first band of red stripes. This is our first sprite. You may be wondering: what about the title sprites? Shouldn't they be there by now? The answer is no: we will paint them when the raster reaches the end of the screen. When it goes to paint the screen a second time (the second 16 milliseconds) they will be ready for painting. We'll see this in action a little later.

So let's see what DoStarfieldAnimation did to get this sprite ready for painting.

When TitleScreenAnimation chose DoStarfieldAnimation as the sub-routine to run it loaded in a value from titleScreenStarFieldYPosArray to the A register:

```
MaybeDoStarFieldOrTitleText
    LDA titleScreenStarFieldYPosArray, Y
    BNE DoStarfieldAnimation
```

Since Y is zero at this point this means it referenced the first value in the array, which is \$48:

```

titleScreenStarFieldYPosArray .BYTE $48,$4E,$54,$5A,$60,$66,$6C,$72
                                .BYTE $78,$7E,$84,$8A,$90,$96,$9C,$A2
                                .BYTE $A8,$AE,$B4,$BA,$C0,$C6,$CC,$D2
                                .BYTE $D8,$DE,$E4,$EA,$F0,$F6
titleScreenStarFieldXPosArray .BYTE $00,$3A,$1A,$C4,$1B,$94,$7B,$96
                                .BYTE $5D,$4F,$B5,$18,$C7,$E1,$EB,$4A
                                .BYTE $8F,$DA,$83,$6A,$B0,$FC,$68,$04
                                .BYTE $10,$06,$A7,$B8,$19,$BB

```

So when `DoStarfieldAnimation` is called the first thing it does is set the y-position of the star to paint to \$48 (72 in decimal):

```

DoStarfieldAnimation
    ; A was loaded from titleScreenStarFieldYPosArray
    ; by the caller.
    STA $DOOF      ;Sprite 7 Y Pos

    ; Set the X position of the star.
    LDA titleScreenStarFieldXPosArray + $01,Y
    STA $DOOE      ;Sprite 7 X Pos

```

Listing 4.15: The start of `DoStarfieldAnimation` responsible for painting stars.

You can also see it then sets the X position of the star using values plucked from `titleScreenStarFieldXPosArray`. So we're leaning heavily on these two arrays to decide where to place stars. But so far, so simple. We've placed the star on the screen more or less and when the raster reaches line 72 it will paint it. There's an additional complication to specifying the X coordinate of the star though and we can't really gloss over it here. We'll also encounter this wrinkle elsewhere too so it's worth pausing on for a moment.

The next few lines of the routine do quite a bit of convoluted work to handle something called the `spriteMSBXPosOffset` of the star. This is our complication.

4.3.1 A Complication

```

; Set the rest of the X position of the star
; if it's greater than 255.
LDA titleScreenStarfieldMSBXPosArray + $01,Y
AND #$01
STA spriteMSBXPosOffset

BEQ StarFieldSkipMSB

LDA #$80
STA spriteMSBXPosOffset
StarFieldSkipMSB

```

```

LDA $D010      ;Sprites 0-7 MSB of X coordinate
AND #$7F
ORA spriteMSBXPosOffset
STA $D010      ;Sprites 0-7 MSB of X coordinate

```

Listing 4.16: MSBXPos.. some'it.

If you look at the diagram again you may recall we said the screen we're painting is 504 pixels wide. Fortunately the only part we can paint is the section in the center that is 320 pixels wide and 200 pixels high.

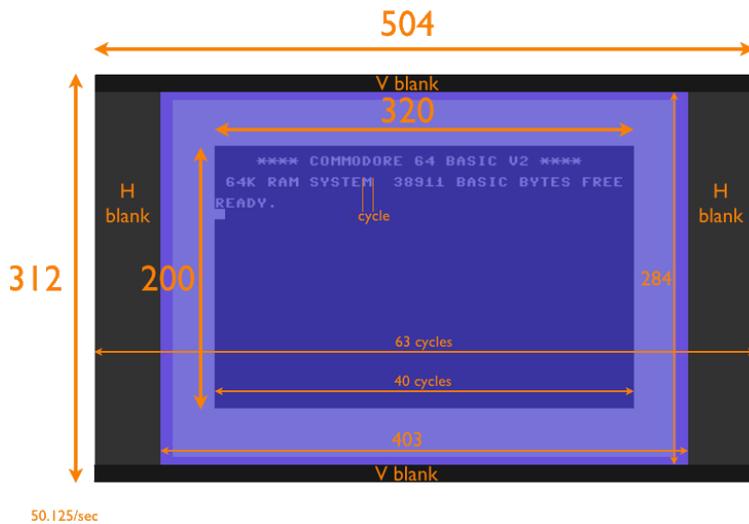

Figure 4.11: The different parts of the screen, we can only paint the bit in the middle. (Source: dustlayer.com)

200 is a value that can be expressed with a single byte. However, 320 is not. A byte can only store a number up to 255 so if we want to specify an X co-ordinate greater than 255 a single byte will not do. The way the C64 works around this is by making a single extra bit for our sprite's X co-ordinate available that brings the available values up from 256 (0 - 255) to 512. Since there are 8 sprites in total we need 8 extra bits to cover this requirement for all of them. For this purpose we use a single byte at address \$D010 that contains the extra bit for all 8 sprites. We refer to this bit as the MSB for the X co-ordinate because it is the 'Most Significant Bit', i.e. the left most bit, in the 9-bit number that we store the X co-ordinate in. That's to say our x co-ordinate is given by combining the value between 0 and 255 we store in our 8-bit byte for 'Sprite 7' in \$D00E and the extra bit we store in \$D010.

Sprite 7	Sprite 6	Sprite 5	Sprite 4	Sprite 3	Sprite 2	Sprite 1	Sprite 0
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0	0	0	0	0	0	0

The most significant bits in \$D010 for each sprite.

Since we are using 'Sprite 7' for painting the starfield the bit we are interested in is bit 7. The way we're going to manage this value for the starfield is by keeping an array `titleScreenStarfieldMSBXPosArray` that indicates whether the x co-ordinate for the current index is greater than 255. If the value in there indicates that it is we'll set our bit in \$D010 to 1.

So when we determine from looking in `titleScreenStarfieldMSBXPosArray` that the x co-ordinate of the star is greater than 256..

```
LDA titleScreenStarfieldMSBXPosArray + $01, Y
AND #$01
STA spriteMSBXPosOffset
```

.. we set `spriteMSBXPosOffset` to indicate that that's the case. That's all this step, with the help of the 'AND #\$01' statement is doing. If 'Bit 1' is set in the value we pluck from `titleScreenStarfieldMSBXPosArray` it is just an indicator that the x co-ordinate for this star is greater than 256. So if we see a value of \$02 in there our operation 'AND #\$01' will give us a zero result, meaning the intended value of the x co-ordinate is not greater than 256, otherwise it will give us a non-zero result indicating that it is set:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$02	0	0	0	0	0	0	1	0
\$01	0	0	0	0	0	0	0	1
Result:	\$00	0	0	0	0	0	0	0

AND'ing \$02 and \$01 gives \$00 (0). For AND to give a 1 both bits must 1 or both must be 0.

This zero result allows BEQ `StarFieldSkipMSB` to evaluate as True so we skip ahead to `StarFieldSkipMSB` to set \$D010. It means for us that the value of the x co-ordinate is not going to be greater than 255. If this is not the case, we instead load a value of \$80 to `spriteMSBXPosOffset` to overwrite the 00 there. This will indicate that the value of the x co-ordinate is greater than 255.

```

BEQ StarFieldSkipMSB

LDA #$80
STA spriteMSBXPosOffset
StarFieldSkipMSB
LDA $D010      ;Sprites 0-7 MSB of X coordinate
AND #$7F
ORA spriteMSBXPosOffset
STA $D010      ;Sprites 0-7 MSB of X coordinate

```

The remaining step above is to load the value we've arrived at in `spriteMSBXPosOffset` to `$D010`. Since we want to do this without affecting any of the other bits in there that have been set for the other sprites we can't just do a `LDA/STA` as that will overwrite what's already there. The combination of the `AND/OR` operations here accomplishes something quite nifty - it allows us to update just the bit (Bit 7) that interests us in `$D010`.

If we suppose the current value in `$D010` is `$F3`, our `AND #$7F` operation clears 'Bit 7' so that it is always set to zero:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$F3	1	1	1	1	0	0	1	1
\$7F	0	1	1	1	1	1	1	1
Result: \$73	0	1	1	1	0	0	1	1

AND'ing `$F3` and `$00` gives `$73`. It clears 'Bit 7' for us of whatever value was there originally.

Now when we perform an 'or' operation on the result with `'ORA spriteMSBXPosOffset'` it will have the effect of just setting 'Bit 7' with the value we've stored in `spriteMSBXPosOffset`. In this case it remains at zero because that's what we have in `spriteMSBXPosOffset`, but if we had `$80` in there it would set it to 1:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$73	0	1	1	1	0	0	1	1
\$00	0	0	0	0	0	0	0	0
Result: \$73	0	1	1	1	0	0	1	1

OR'ing `$73` and `$00` gives `$73`.

4.3.2 Back to the Beam

Now that we've fixed the star's co-ordinates there's just two more things left to do before we're done with handling this raster interrupt. One is to set the color of the star. We do this using a look-up array where we get the color for the star per our current index and set it:

```
LDA titleScreenStarFieldColorsArrayLookUp,Y  
TAX  
LDA titleScreenColorsArray - $01,X  
STA $D02E ;Sprite 7 Color
```

The second, and most important, is that we update the position on the screen that we want the next interrupt to happen. Remember for this visit we were interrupted at line 17. We want to place stars on other lines so we keep a list of the lines we want to write stars on in `titleScreenStarFieldYPosArray`, i.e. an array that stores the y co-ordinates of our stars. What we do is simply update the Raster Interrupt with the next position from this array so that we get called when the raster reaches it:

```
; Update the raster position for the next interrupt  
; to the current line - 1. This will allow us to  
; draw the sprite multiple times on different lines.  
LDA titleScreenStarFieldYPosArray + $01,Y  
SEC  
SBC #$01  
STA $D012 ;Raster Position
```

In this instance we're setting the value to \$48 (72). So when the next interrupt happens it will reveal the star we just prepared. This is the one we took a peek at in Figure 1.10.

The next ten interrupts will continue to revisit `DoStarfieldAnimation`. Let's look at the screen as it unfolds through each of these interrupts:

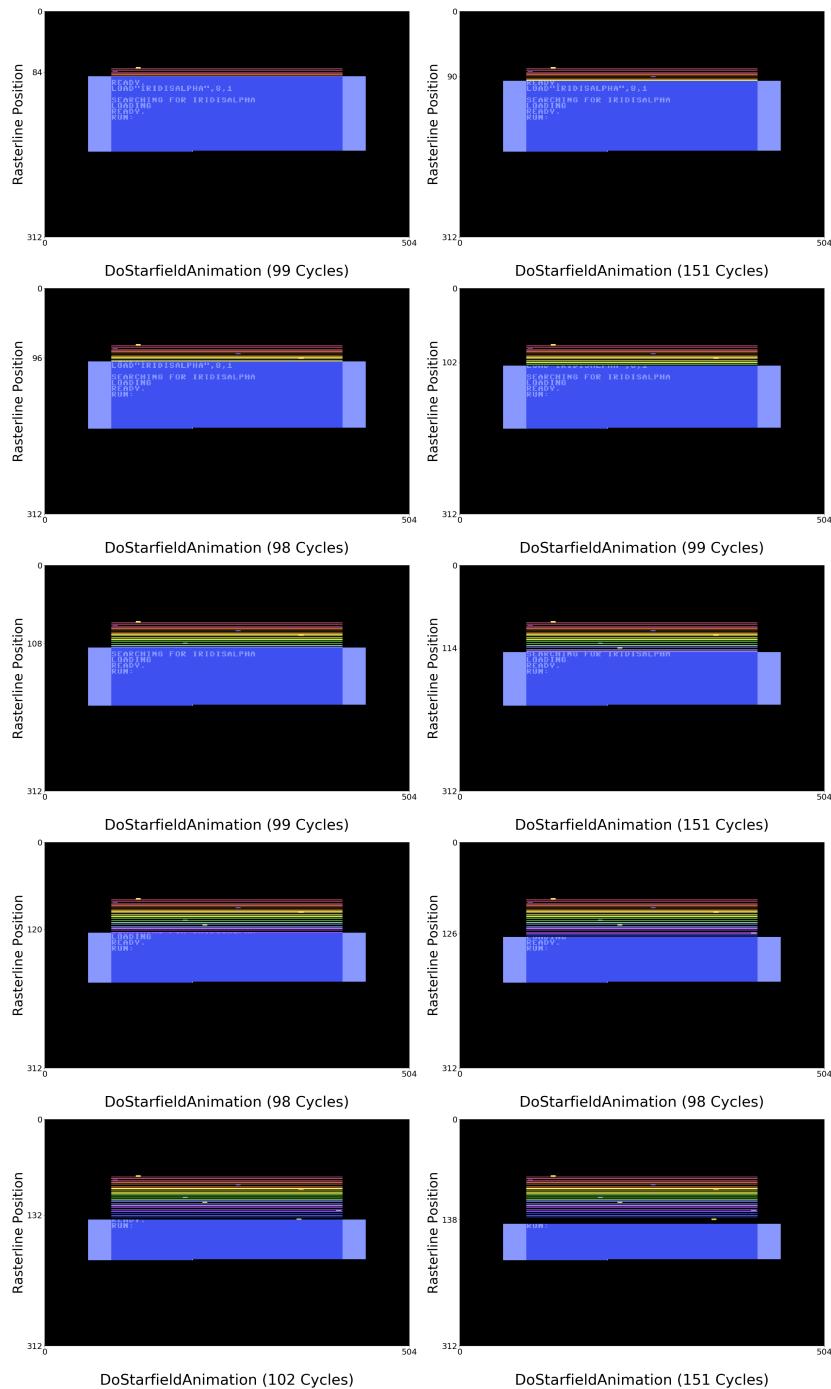

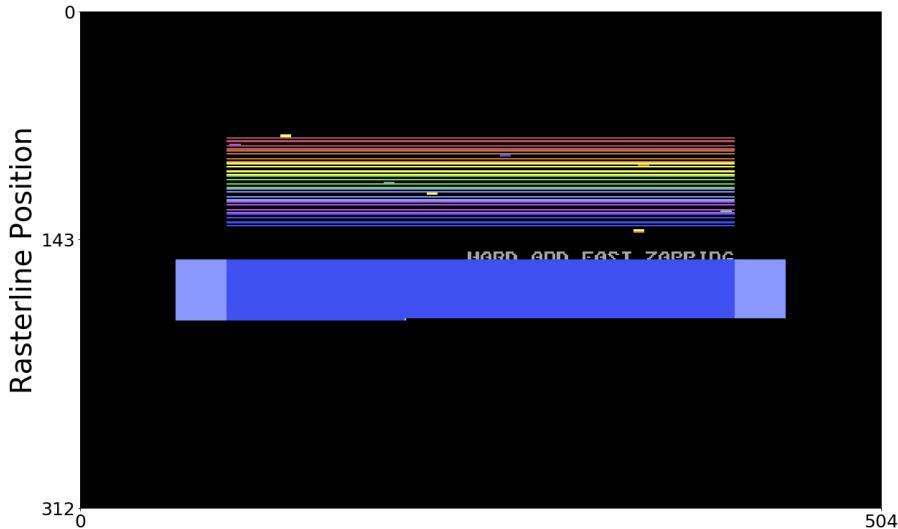

Figure 4.12: The next ten interrupts paint the starfield on the screen until we reach the point at which we want to prepare the gilby sprites.

4.4 Enter The Gilbies

`UpdateJumpingGilbyPositionsAndColors (546 Cycles)`

Figure 4.13: The point we reach in the screen paint when we decide to prepare the gilby sprites.

Finally we've reached a point in the screen where we're not just going to add another star to the background. We've been keeping a count of the number of interrupts we've handled in `titleScreenStarFieldAnimationCounter`. When it reaches \$0C (12) we've handled the raster interrupt twelve times and painted nothing but the text background we prepared earlier and the stars we've added along the way. Now's the time to do something else:

```

TitleScreenAnimation
LDY titleScreenStarFieldAnimationCounter
CPY #$0C
BNE MaybeDoStarFieldOrTitleText

JSR UpdateJumpingGilbyPositionsAndColors
LDY #$10
STY titleScreenStarFieldAnimationCounter

```

The routine we call into here by the name of `UpdateJumpingGilbyPositionsAndColors` will prepare the sequence of jumping rainbow gilbies somewhere in the lower half of the screen before our current raster line. That's why we call it at this point in the

raster's journey - because the raster hasn't reached that position in the screen yet (but will reach it shortly) so now is our opportunity to position the gilbies where we want them.

Since this is an animation sequence we're managing, the approach of `UpdateJumpingGilbyPositionsAndColors` is simply to update their position on the screen. Calculating this new position is something that happens a little later in another routine `RecalculateJumpingGilbyPositions` when we are nearer the bottom of the screen. This means the position values we're picking up here are the initial ones set in the game's code:

<code>titleScreenGilbiesYPosArray</code>	<code>.BYTE \$B2,\$B6,\$BB,\$C1,\$D0,\$C8,\$C1</code>
<code>titleScreenGilbiesXPosArray</code>	<code>.BYTE \$54,\$58,\$5C,\$60,\$64,\$68,\$6C</code>

The next time around we will pick up the positions as re-calculated by `RecalculateJumpingGilbyPositions`. So the positioning of the gilbies and the calculation of the updated positions happen separately. The reason for that approach is simple: there isn't enough time right now to do anything but simply update the positions the gilbies are displayed at. Later on, when the raster has passed line 320 we will have a lot more time available to perform complex calculations because we don't need to worry about the raster painting anything on the screen for a while.

Since there are 7 of them, setting the x and y co-ordinates of the seven gilby sprites is handled by a loop:

```

; Loop through the gilby sprites in the title screen and
; update their position and color
LDX #$00
UpdateJumpingGilbiesLoop
    TXA
    ASL
    TAY
    LDA titleScreenGilbiesXPosArray,X
    ASL
    STA $D000,Y ;Sprite 0 X Pos
    BCC SkipGilbyMSBXPos
    LDA $D010      ;Sprites 0-7 MSB of X coordinate
    ORA titleScreenGilbiesMSBXPosArray,X
    STA $D010      ;Sprites 0-7 MSB of X coordinate
    JMP UpdateYPosJumpingGilbies

SkipGilbyMSBXPos
    LDA $D010      ;Sprites 0-7 MSB of X coordinate
    AND titleScreenGilbiesMSBXPosOffset,X
    STA $D010      ;Sprites 0-7 MSB of X coordinate

UpdateYPosJumpingGilbies
    LDA titleScreenGilbiesYPosARray,X

```

```
STA $D001,Y ;Sprite 0 Y Pos
LDA currentTitleScreenGilbySpriteValue
STA Sprite0Ptr,X

; Update Gilby color.
LDA titleScreenColorsArray,X
STA $D027,X ;Sprite 0 Color

INX
CPX #$07
BNE UpdateJumpingGilbiesLoop
RTS
```

Listing 4.17: The loop in `UpdateJumpingGilbyPositionsAndColors` updating the x and y position on screen and color of each of the gilby sprites.

We can see in here the verbosity required to handle the most significant bit of the sprite's x co-ordinate. Just as with the starfield we need a separate array (`titleScreenGilbiesMSBXPosArray`), in addition to arrays that manage the basic x/y positions themselves.

With the gilbies prepared we fall through and update the starfield again. Once that's done we're finished handling the current raster interrupt. This is followed by another dozen or so interrupts where we again just prepare stars for display and as the raster progresses our gilbies are revealed.

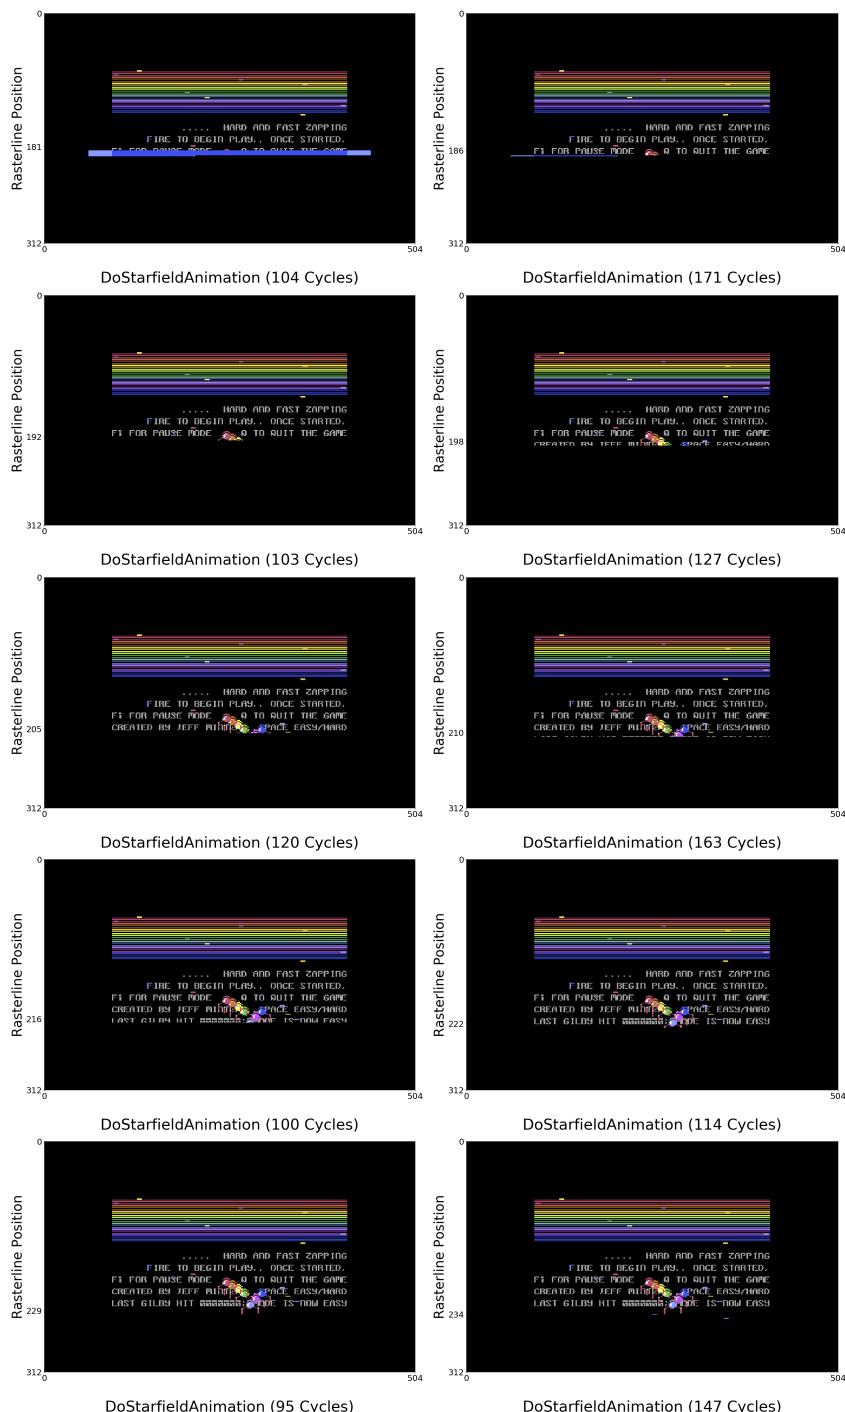

Figure 4.14: Behold the gilbies.

4.5 Title Text

UpdateTitleTextSprites and Music (1002 Cycles)

Figure 4.15: We've finally reached the bottom of the screen, with gilbies and stars painted, but still no title.

We've finally reached the bottom of the screen in our first raster paint, at least the bottom of the portion of the screen that we can paint. When the raster hits line 270 we're beyond the point that we can place anything on the screen and into the border area. This gives us time to do some more complicated and time consuming stuff.

There's a relatively full agenda:

```

LDA #$10
STA $D012      ;Raster Position

; Acknowledge the interrupt, so the CPU knows that
; we have handled it.
LDA #$01
STA $D019      ;VIC Interrupt Request Register (IRR)
STA $D01A      ;VIC Interrupt Mask Register (IMR)

; All of this stuff can be done before the raster
; reaches the top of the screen again.
JSR UpdateTitleTextSprites
JSR MaybeUpdateSpriteColors

```

```

JSR RecalculateJumpingGilbyPositions
JSR PlayTitleScreenMusic
JMP ReEnterInterrupt

```

First of all we set the raster interrupt to line 16 at the top of the screen again, then we acknowledge the interrupt. The raster will continue its journey but because we're going to do this while it works its way through the next 42 lines at the bottom of the screen we have more time than at any point previously to get things done.

Adding the title sprites is relatively light work. Just as with the gilbies we use a tight loop to paint each of them on the screen. There's no animation to handle here.

```

titleTextSpriteArray .BYTE $20,BIG_I,BIG_R,BIG_I,BIG_D,BIG_I,BIG_S
...
PaintSpriteLettersLoop
; Assign the sprite.
LDA titleTextSpriteArray,X
STA SpriteOPtr - $01,X

; Shift the value in X left 1 bit and assign to Y.
; So e.g. 6 becomes 12, 5 becomes 10, 4 becomes 8,
; 3 becomes 6 and so on. This allows us to use Y
; as an offset to the appropriate item in $D000-
; $D012 for updating the sprite's position.
TXA
ASL
TAY

; Update the X Position of the sprite
LDA titleTextXPosArray - $01,X
STA $D000 - $02,Y

LDA $D010 ;Sprites 0-7 MSB of X coordinate
ORA titleTextMSBXPosArray,X
STA $D010 ;Sprites 0-7 MSB of X coordinate

; Update the Y position of the sprite
LDA #$40
STA $D000 - $01,Y
DEX
BNE PaintSpriteLettersLoop

```

The other complex thing we do is calculate the next step in the jumping gilby animations. `RecalculateJumpingGilbyPositions` updates the x and y positions of the gilby sprites in `titleScreenGilbiesYPosArray` and `titleScreenGilbiesXPosArray`.

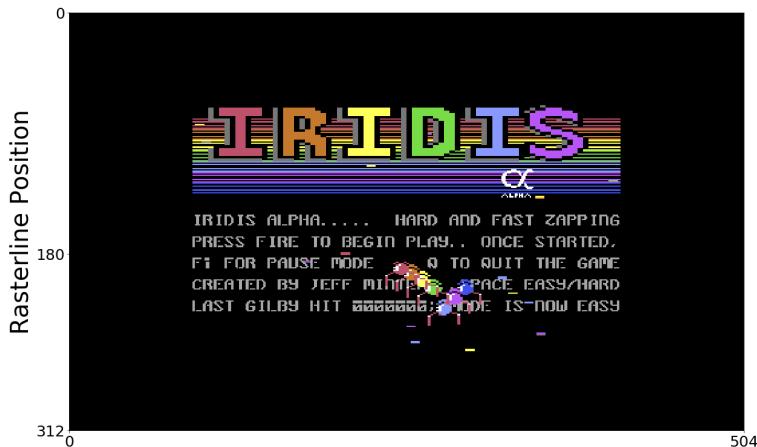

Finally we play a single note from the title music (`JSR PlayTitleScreenMusic`), we cover the music of Iridis Alpha in detail in a later chapter.

For now though the raster continues on its journey and progresses through its second paint journey of the screen. The title sprites are finally revealed.

Figure 4.16: The title text is finally revealed

And with that the title sequence is finally up and running after 20 milliseconds or so.

DoStarfieldAnimation (98 Cycles)

Figure 4.17: We're done here.

Making Planets for Nigel

Jeffrey Says

Redid the graphics completely, came up with some really nice looking metallic planet structures that I'll probably stick with. Started to write the GenPlan routine that'll generate random planets at will. Good to have a C64 that can generate planets in its spare time. Wrote pulsation routines for the colours; looks well good with some of the planet structures. The metallic look seems to be 'in' at the moment so this first planet will go down well. There will be five planet surface types in all, I reckon, probably do one with grass and sea a bit like 'Sheep in Space', cos I did like that one. It'll be nice to have completely different planet surfaces in top and bottom of the screen. The neat thing is that all the surfaces have the same basic structures, all I do is fit different graphics around each one.

When the player presses fire we will leave the title screen and enter the world of the game. Since the game insists on having a world, that means we are going to have to create one. With enemies, and a ship that we can move and fire bullets out of. We will also need planets. That sounds like a lot of work to be honest.

Fortunately, making planets is easy. So we can start there.

When making a planet, ensure you perform each of the following simple steps in the order given below.

Figure 5.1: **Step One:** Add the sea across the entire surface of the planet, 1024 bytes long.

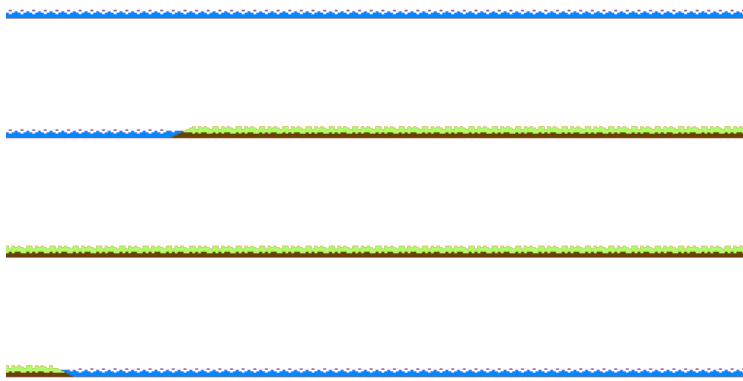

Figure 5.2: **Step Two:** Insert a land mass at least 32 bytes and at most 128 bytes long.

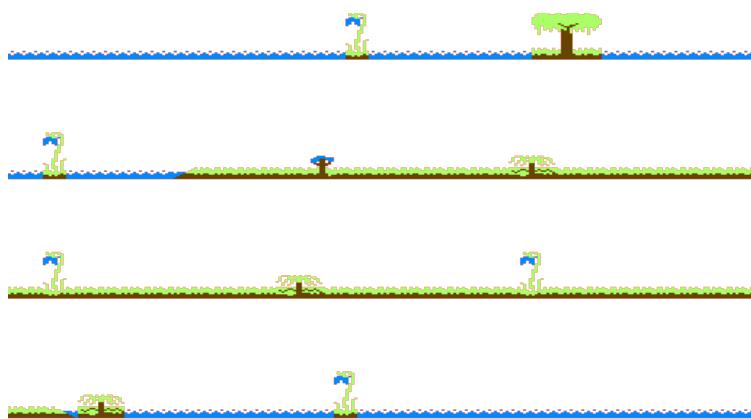

Figure 5.3: **Step Three:** Add a random structure every 13 to 29 bytes.

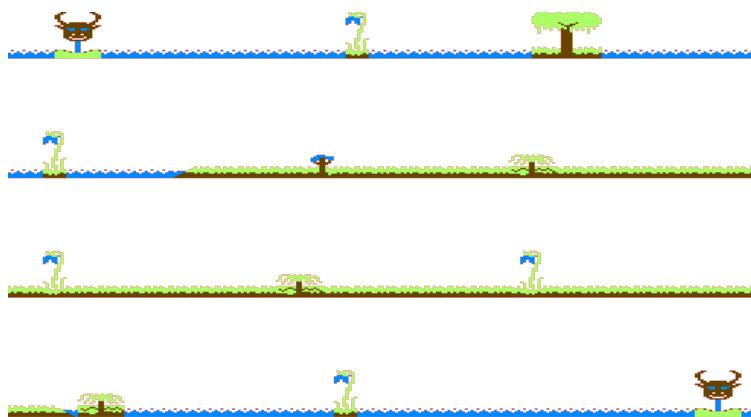

Figure 5.4: **Step Four:** Add warp gates at the beginning and end of the planet surface.

Now you have not just a layout for one planet, but a layout for all five.

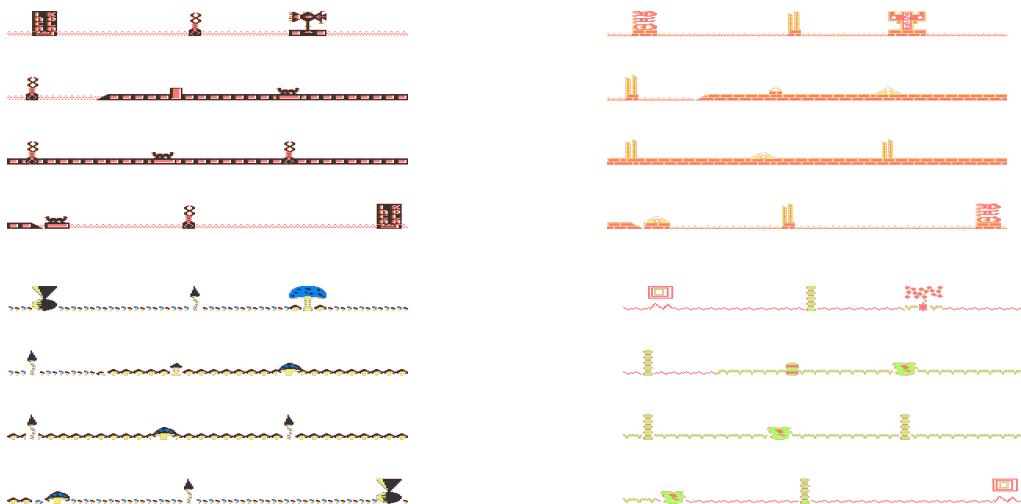

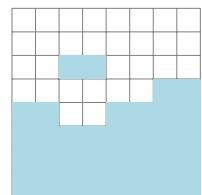

Figure 5.5: A layout that will suit all the planets in your life.

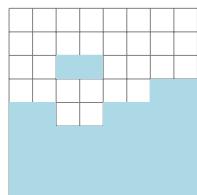

But making planets isn't all simple steps and big picture decisions. There are also trifling details for the little people to wrestle with.

5.1 Step One: Creating the Sea

Making a sea is very easy. You come up with a character than can be repeated 1024 times to fill the surface of the planet.

planet1Charset \$40

planet1Charset \$42

Figure 5.6: There are two characters used for creating the sea and they're both the same! This will make more sense when we look at the land, where they are different.

Figure 5.7: planet1Charset Sea

The bit that needs explaining is how you define the character. If it was a simple bitmap then we could imagine the character as 8 rows of 8 bits and where a bit is set to 1 you color that pixel in. That is not the case. You can see how the bits are actually set below:

0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	1	0	0	0	0	0
0	0	0	0	0	0	1	0
1	0	0	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0

Figure 5.8: planet1Charset \$40 representing a tile of sea.

Look closely at the picture above and you should see how it works. What is happening is that we fill two adjacent cells with blue when together they form the value 10. So we create graphic characters not with a simple bit-map but with a map of bit pairs. Each pair of bits is treated as a unit giving us four units on each row. Maybe it's intuitively obvious that 00 means 'blank' or 'background' but I've pointed that out to you now just in case.

```
planet1Charset
    .BYTE $00,      ; 00000000
    .BYTE $00,      ; 00000000
    .BYTE $20,      ; 00100000      *
    .BYTE $02,      ; 00000010      *
    .BYTE $8A,      ; 10001010      * * *
    .BYTE $AA,      ; 10101010      * * * *
    .BYTE $AA,      ; 10101010      * * * *
    .BYTE $AA,      ; 10101010      * * * *
```

Listing 5.1: Character \$40 representing the sea as it is defined in the source code. A full eight bytes are required to define each character so not cheap.

Is that all there is to it? No. Before we look at how me might color things other than blue, let's look at how we color them with the big blue brush we have so far. The first thing we do is clear down the entire surface of the planet:

```
; Clear down the planet surface data from $8000 to $8FFF.  
; There are 4 layers:  
; Top Layer:    $8000 to $83FF - 1024 bytes  
; Second Layer: $8400 to $87FF - 1024 bytes  
; Third Layer:  $8800 to $8BFF - 1024 bytes  
; Bottom Layer: $8C00 to $8FFF - 1024 bytes  
LDY #$00  
ClearPlanetHiPtrs  
    ; $60 is an empty character and gets written to the entire  
    ; range from $8000 to $8FFF.  
    LDA #$60  
ClearPlanetLoPtrs  
    STA (planetSurfaceDataPtrLo),Y  
    DEY  
    BNE ClearPlanetLoPtrs  
    INC planetSurfaceDataPtrHi  
    LDA planetSurfaceDataPtrHi  
    CMP (#>planetSurfaceData) + $10  
    BNE ClearPlanetHiPtrs
```

Listing 5.2: The surface data is stored from \$8000 to \$8FFF. This code overwrites it all with the value \$60 which is an empty bitmap.

```
.BYTE $00,      ; 00000000  
.BYTE $00,      ; 00000000
```

Listing 5.3: The empty character bit map (all zeroes) used to overwrite the surface before populating it.

With the planet surface cleared out (overwritten with all \$60s) we can now.. overwrite it all again with sequences of \$40,\$42. No, that's not right. We're only overwriting the bottom layer - the surface layer - this time. This is the layer that contains the land and/or sea and it lives between \$8C00 and \$8FFF which if your hexadecimal arithmetic is better than mine you will realize is 1024 bytes (\$400 in hex).

```
; Fill $8C00 to $8FFF with a $40,$42 pattern. These are the  
; character values that represent 'sea' on the planet.  
LDA #$8C  
STA planetSurfaceDataPtrHi  
WriteSeaLoop  
    LDA #$40  
    STA (planetSurfaceDataPtrLo),Y  
    LDA #$42  
    INY  
    STA (planetSurfaceDataPtrLo),Y  
    DEY
```

```

; Move the pointers forward by 2 bytes
LDA planetSurfaceDataPtrLo
CLC
ADC #$02
STA planetSurfaceDataPtrLo
LDA planetSurfaceDataPtrHi
ADC #$00
STA planetSurfaceDataPtrHi
; Loop until $8FFF
CMP #$90
BNE WriteSeaLoop

```

Listing 5.4: Filling the entire bottom surface of the planet with \$40,\$42 which gives us the sea. Our next step is to overwrite some of this with land.

Figure 5.9: That sea again. Our work so far.

5.2 Step Two: Creating the Land

Is that all there is to it? Painting things with blue? No.

There are other possible values aside from 10 and 00 that we could use to paint colors. We could also have 11 and 01. This is useful since we want to color things in with more than one color. We have blue assigned to 10 on Planet 1, while for the land we can use two other colors: 11 which we will assign 'green' and 01 which we will assign 'brown'. We can assign whatever colors we like but we can only choose three, not counting the background. This is the kind of limitation you run into when you only allow two bits for assigning possible colors.

1	1	0	0	1	1	0	0
1	1	0	0	1	1	1	1
1	1	1	1	1	1	1	1
1	1	1	1	1	1	1	1
1	1	0	1	1	1	0	1
0	1	0	1	0	1	0	1
0	1	0	1	0	1	0	1
0	1	0	1	0	1	0	1

planet1Charset \$41

1	1	0	0	0	0	1	1
1	1	1	1	0	0	1	1
1	1	1	1	1	1	1	1
1	1	1	1	1	1	1	1
0	1	1	1	1	1	0	1
0	1	0	1	0	1	0	1
0	1	0	1	0	1	0	1
0	1	0	1	0	1	0	1

planet1Charset \$43

Figure 5.10: Planet 1 Land uses two different characters that alternate to generate the land surface.

Figure 5.11: planet1Charset Land

The location and length of the landmass is randomly generated with a couple of constraints: it must be at least 128 bytes and not more than 256 bytes from the start of surface and it must be at least 32 bytes and not more than 150 bytes long. The result is that the planet surface will be mostly sea since the entire surface is 1024 bytes long.

Picking a random number between 128 and 256 is slightly convoluted in assembly:

```
; Get a random number between 0 and 256 and store
; in A.
JSR PutProceduralByteInAccumulatorRegister
; Ensure the random number is between 128 and 256.
AND #$7F ; e.g. $92 becomes $12.
CLC ; Clear the carry so addition doesn't overflow.
ADC #$7F ; e.g. Adding $7F to $12 gives $91 (145).
; Store the result.
STA charSetDataPtrHi
```

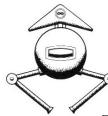

Listing 5.5: Convoluted.

With a random start position selected, a similar convolution is performed to choose the length of the land mass:

```
; Randomly generate the length of the land section, but
; make it at least 32 bytes and not more than 150.
JSR PutProceduralByteInAccumulatorRegister
AND #$7F ; Random number between 0 and 128
CLC
ADC #$20 ; Add 32
STA planetSurfaceDataPtrLo
```

Listing 5.6: A convolution.

Since the random number we get can be anything between \$00 – \$FF (i.e. 0 and 255) and we want a number that's between 0 and 128 we need to do a bitwise AND to mask out Bit 7 which by itself is 128.

A Neat Little Trick

This little snippet's job is to return a quasi-random byte for use in the planet generation routines. To achieve this, it does something quite fiendish that is more or less unheard of in modern programming: it mutates itself.

```
PutProceduralByteInAccumulatorRegister
randomIntToIncrement    =+$01
    LDA randomPlanetData
    INC randomIntToIncrement
    RTS
```

Listing 5.7: Neat.

When called for the first time it loads a value from the address at `randomPlanetData` to the accumulator. On first run `randomPlanetData` points to the address \$9ABB which contains the value \$42:

```
randomPlanetData
.BYTE $42,$E4,$3F,$94,$4E,$29,$B0,$59
.BYTE $2C,$FE,$7F,$B2,$40,$9B,$63,$2B
```

Listing 5.8: Not Quite Random Bytes

Before returning this value as its result it alters itself by changing `randomPlanetData` to reference \$9ABC (`INC randomIntToIncrement`). In other words, it increments the pointer. In the assembly listing we make `randomIntToIncrement` reference the position that holds `randomPlanetData` by positioning it one byte before and adding a 1 to shift its reference beyond the byte holding `LDA` to `randomPlanetData`.

Every time the routine is called it increments the reference again so that the next time it will pick up whatever lies in the bytes beyond 9ABB. The results it returns are never truly random, but random enough to permit the procedural generation of planets that they're used for.

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$FC	1	1	1	1	1	1	0	0
\$7F	0	1	1	1	1	1	1	1
Result; \$7C	0	1	1	1	1	1	0	0

AND'ing \$FC and \$7F gives \$7C (124).

With the position and length selected we can start laying turf. We don't just plop down

our basic land tiles. Posh and proper means giving the shore of the land its own look and feel. This we have in the characters \$5C,\$5E and \$5D,\$5F in our character set:

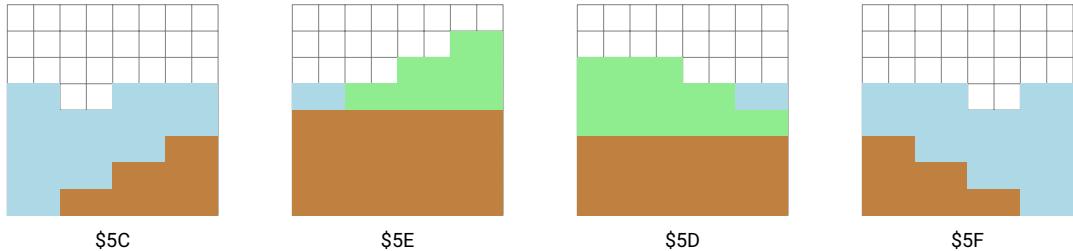

Figure 5.12: Character tiles for the left shore (\$5C,\$5E) and the right shore (\$5D,\$5F).

Now we can put the rest of the land down:

```
; Draw the land from the randomly chosen position for up to
; 150 bytes, depending on the randomly chosen length of the land
; chosen above and stored in planetSurfaceDataPtrLo.
DrawLandMassLoop
    INC charsetDataPtrHi
    BNE b7420

    INC charsetDataPtrLo
b7420  JSR StoreRandomPositionInPlanetInPlanetPtr
    LDY #$00
    LDA #$41
    STA (planetPtrLo),Y
    LDA #$43
    INY
    STA (planetPtrLo),Y
    DEC planetSurfaceDataPtrLo
    BNE DrawLandMassLoop
```

Listing 5.9: Write pairs of \$41,\$43 for the main land mass.

And finally the right shore:

```
; Draw the right short of the land, represented by the chars in
; $5D/$5F.
INY
LDA #$5D
STA (planetPtrLo),Y
LDA #$5F
INY
STA (planetPtrLo),Y
```

Listing 5.10: Drawing the right hand shore..

5.3 Step Three: Structures Structures Structures

The routines for adding structures to the planet are an opportunity to observe some assembly language cleverness. For each structure we draw we have to decide two things: where to drop it on the surface and what type of structure to draw. Apart from the Warp Gates, there are four structure types available.

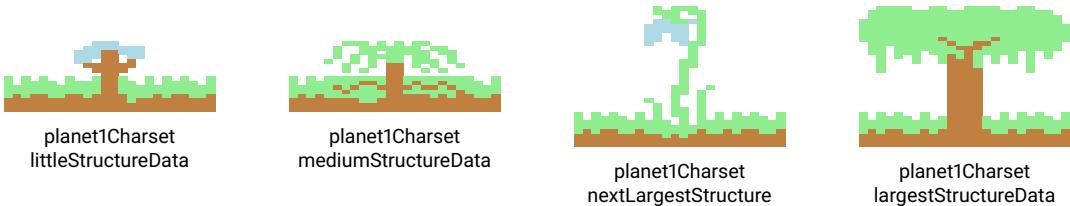

Figure 5.13: The four possible structure types for Planet 1.

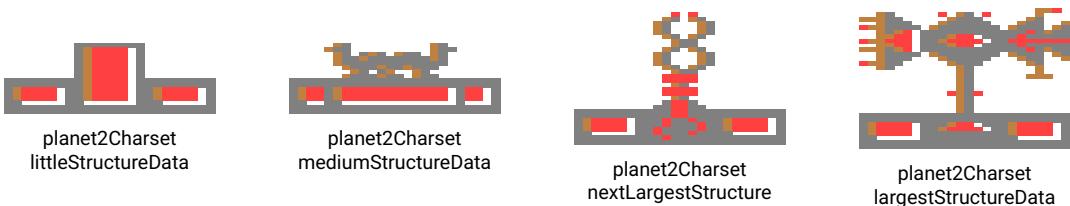

Figure 5.14: The four possible structure types for Planet 2.

You may be getting the sense that there is a sort of economy at work here. The structures are effectively the same for each planet, but with the textures swapped out. Your intuition is correct, the structures are only defined once and the same definition is used regardless of which planet we're painting:

```

littleStructureData    .BYTE $45,$47,$FF
                     .BYTE $44,$46,$FE
mediumStructureData   .BYTE $65,$67,$69,$6B,$FF
                     .BYTE $64,$66,$68,$6A,$FE
largestStructureData  .BYTE $41,$43,$51,$53,$41,$43,$FF
                     .BYTE $60,$60,$50,$52,$60,$60,$FF
                     .BYTE $49,$4B,$4D,$4F,$6D,$6F,$FF
                     .BYTE $48,$4A,$4C,$4E,$6C,$6E,$FE
nextLargestStructure .BYTE $59,$5B,$FF
                     .BYTE $58,$5A,$FF
                     .BYTE $55,$57,$FF

```

```
.BYTE $54,$56,$FE
```

Listing 5.11: The definitions of three of the structures above each of which serves all five planets.

The \$FF at the end of each line serves as a sentinel for the drawing routine to know that the subsequent bytes are for the next layer 'up'. The \$FE is a terminator, indicating there is no more data for the structure.

Drawing a structure is relatively straightforward so we'll cover that briefly first. Drawing the littlest structure provides the most compact example of the technique:

```
DrawLittleStructure
; Start iterating at 0.
LDX #$00
DrawLSSLoop
; Get the byte in littleStructureData pointed to
; by X.
LDA littleStructureData,X
; If we reached the 'end of layer' sentinel, move
; our pointer planetPtrHi to the next layer. The
; BNE 'stays on the same layer' by jumping to
; LS_StayonSameLayer if the current byte
; is not $FF.
CMP #$FF
BNE LS_StayonSameLayer
; Switch to the next layer.
JSR SwitchToNextLayerInPlanet
; SwitchToNextLayerInPlanet incremented X for us
; so continue looping.
JMP DrawLSSLoop

LS_StayonSameLayer
CMP #$FE
; If we read in an $FE, we're done drawing.
BEQ ReturnFromDrawingStructure
STA (planetPtrLo),Y
; Increment Y to the next position to write to.
INY
; Increment X to get the next byte to read in.
INX
; Continue looping.
JMP DrawLSSLoop
```

Listing 5.12: The littlest structure has only two layers.

Given that we're only writing 4 bytes this is a lot of code. As we will see there are separate routines for each of the structures and unfortunately for our search for evidence of coding genius they're all identical. So this is a pretty open-and-shut case of code duplication. It would have been more compact to rationalize them down to a single function and use a pointer to the structure data instead of repeating almost verbatim the same assembly code for each structure.

```

; -----
; DrawMediumStructure ($74B1)
; -----
DrawMediumStructure
    LDX #$00

DrawMSLoop
    LDA mediumStructureData,X
    CMP #$FF
    BNE b74C0
    JSR SwitchToNextLayerInPlanet
    JMP DrawMSLoop

b74C0   CMP #$FE
        BEQ ReturnFromDrawingStructure ; Return
        STA (planetPtrLo),Y
        INY
        INX
        JMP DrawMSLoop

; -----
; DrawLargestStructure ($74CB)
; -----
DrawLargestStructure
    LDX #$00

DrawLargeStructureLoop
    LDA largestStructureData,X
    CMP #$FF
    BNE b74DA
    JSR SwitchToNextLayerInPlanet
    JMP DrawLargeStructureLoop

b74DA   CMP #$FE
        BEQ ReturnFromDrawingStructure ; Return
        STA (planetPtrLo),Y
        INY
        INX
        JMP DrawLargeStructureLoop

```

Listing 5.13: DrawMediumStructure and DrawLargestStructure are identical to each other and to DrawLittleStructure and DrawNextLargestStructure.

The cleverness comes a little earlier so let's console ourselves with that. When we've chosen a position to draw our structure we need to pick a type of structure at random. The secret to this is to store the addresses to our regrettably repetitive draw routines in a pair of arrays.

```

; Jump table
structureSubRoutineArrayHiPtr
    .BYTE >DrawLittleStructure,>DrawMediumStructure
    .BYTE >DrawLargestStructure,>DrawNextLargestStructure

```

```

structureSubRoutineArrayLoPtr
.BYTE <DrawLittleStructure,<DrawMediumStructure
.BYTE <DrawLargestStructure,<DrawNextLargestStructure

```

Listing 5.14: A ‘jump table’ containing the addresses to our draw routines. The address for DrawLittleStructure happens to be \$7486 so we store \$74 in the first byte of structureSubRoutineArrayHiPtr and \$86 in the first byte of structureSubRoutineArrayLoPtr.

With this in place our routine consists of getting a random number between 0 and 3, then using that as an index to pick out a value at the same position from structureSubRoutineArrayLoPtr and structureSubRoutineArrayHiPtr. We then store those values in structureRoutineLoPtr and structureRoutineHiPtr respectively. We now have a pointer to one of our draw routines at structureRoutineLoPtr which we can jump to with the simple command: JMP (structureRoutineLoPtr).

```

; -----
; DrawRandomlyChosenStructure
; -----
DrawRandomlyChosenStructure
    ; Pick a random position to draw the structure
    JSR StoreRandomPositionInPlanetInPlanetPtr

    ; Run the randomly chose subroutine, one of:
    ; DrawLittleStructure, DrawMediumStructure,
    ; DrawLargestStructure, DrawNextLargestStructure
    ; to draw a structure on the planet surface

    ; Pick a random number between 0 and 3
    JSR PutProceduralByteInAccumulatorRegister
    ; AND'ing with $03 ensures the number is between
    ; 0 and 3.
    AND #$03
    ; Move the number to the X register.
    TAX
    ; Use the random number to pick and draw a structure.
    LDA structureSubRoutineArrayHiPtr,X
    STA structureRoutineHiPtr
    LDA structureSubRoutineArrayLoPtr,X
    STA structureRoutineLoPtr
    ; With the address of the routine we've chosen copied
    ; to structureRoutineLoPtr, we jump to that address and
    ; run the routine.
    JMP (structureRoutineLoPtr)
    ; The routine contains an 'RTS' so does the returning
    ; for us.

```

Listing 5.15: DrawRandomlyChosenStructure picks a random position and a random draw routine to use at that position.

Rinse and repeat this for the length of the map and we get a surface with sea and land that is dotted with structures of different types.

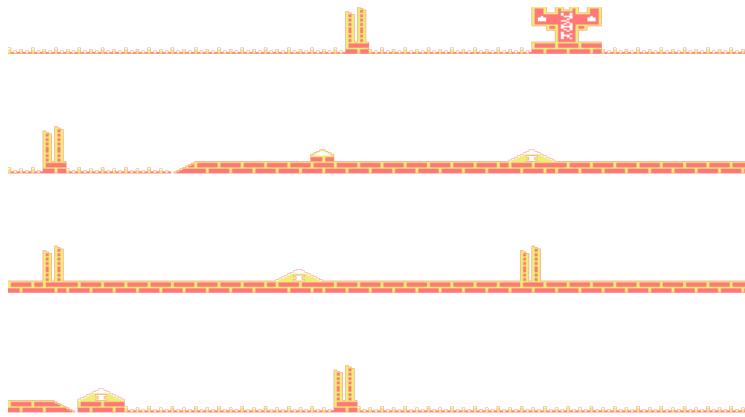

Figure 5.15: Planet 3 once `DrawRandomlyChosenStructure` has finished its business.

5.4 Step Four: Add the warp gate

Our final step is to add the warp gate.

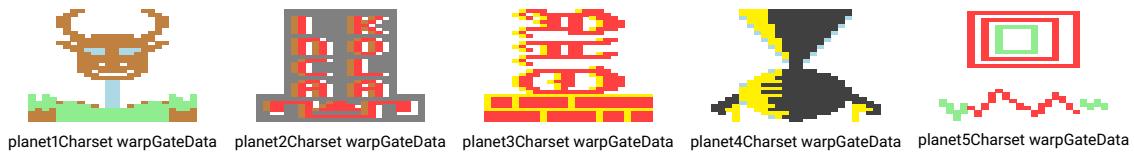

Figure 5.16: The warp gates on each planet.

There's something funny here I haven't figured out yet. The routine for drawing the warp gate draws it twice. Yet each level has only one warp gate. Each one gets an initial position of \$F1 and \$05 respectively. This is used by `StoreRandomPositionInPlanetInPlanetPtr` to point to a position on the surface where the warp gate is drawn.

```

DrawWarpGates
    LDA  charSetDataPtrLo
    BEQ  GenerateStructuresLoop

    ; Draw a warp gate at the end of the map.
    LDA  #$F1

```

```

STA charSetDataPtrHi

JSR StoreRandomPositionInPlanetInPlanetPtr
JSR DrawWarpGate
DEC charSetDataPtrLo

; Draw a warp gate at the start of the map.
LDA #$05
STA charSetDataPtrHi

JSR StoreRandomPositionInPlanetInPlanetPtr
JSR DrawWarpGate

```

Listing 5.16: Why does it draw 2 warp gates when there's only 1? Haven't figured this out yet..

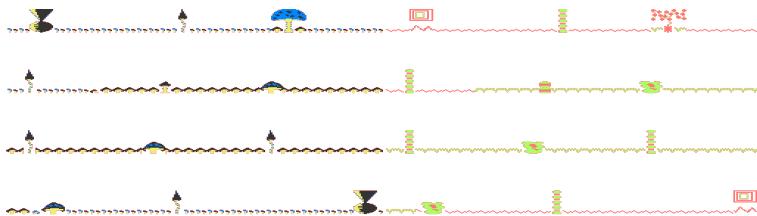

Figure 5.17: The final surfaces for Planets 4 and 5.

5.5 Inactive Lower Planet

When the lower planet is inactive a surface with land, sea, and a warp gate is displayed. This doesn't reuse any of the logic described above. Instead it is generated from some customized data in the routine `DrawLowerPlanetWhileInactive`.

```

; -----
; DrawLowerPlanetWhileInactive
; Draws the lower planet for the early levels when it isn't
; active yet.

Listing 5.17: Draw the inactive lower planet.

5.6 Drawing the Lower Planet

Drawing the upper planet is all very well. The data is just there and as we have seen it's just a question of 'writing it to the screen'. For the lower planet, which is just an upside down version of the upper one, we could store the data all over again, but inverted. Or we could try something a little more clever, so let's be clever.

Our clever trick will be to take each character definition for the upper planet and shift its bits around so that we can turn it into an upside down version of the original. This avoids the need to store everything twice. Instead we store it once for the upper planet and just mutate it for the lower planet.

0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	1	0	0	0	0	0
0	0	0	0	0	0	1	0
1	0	0	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0

A Piece of Sea

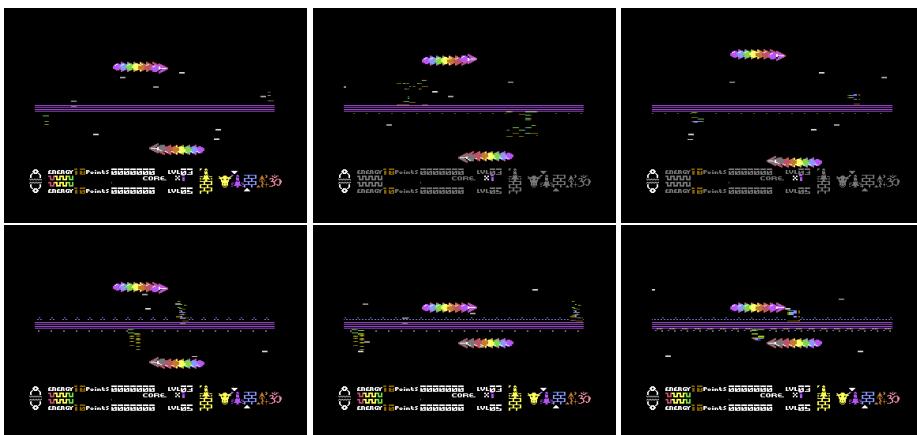

1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	0	0	1	0
1	0	0	0	0	0	0	0
0	0	0	0	1	0	0	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0

An Upside Down Piece of Sea

Figure 5.18: The character set definition for a piece of land and its topsy-turvy counterpart.

Doing this all at once for the full planet would be expensive and there will never be a good time to do it. So what we'll do instead is make a chutney from this pickle and do the heavy lifting while distracting the player's attention with an impressive-looking level-entry sequence.

When the player enters a pair of planets for the first time we'll slowly materialize the planet surfaces while quietly loading the upper planet data and converting it for the lower planet too. If we make this entry sequence long enough we'll have time to populate all 256 bytes of each planet's surface.

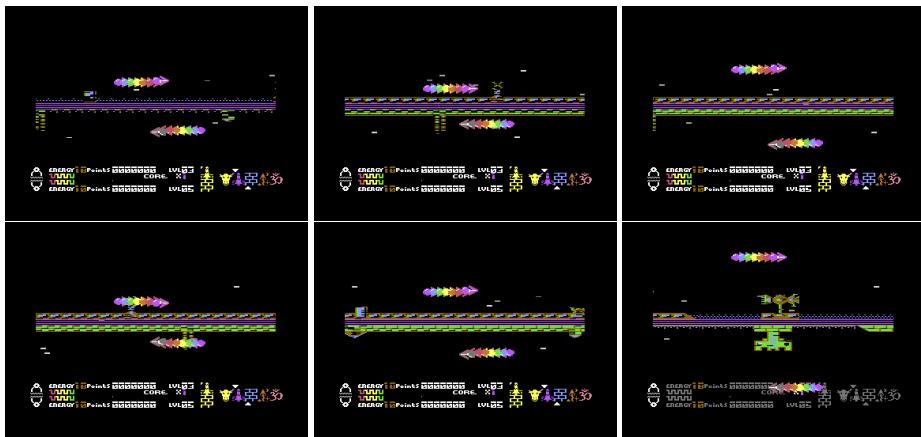

Figure 5.19: The materialization sequence as we enter a new pair of planets.

The trickery takes place in `MaybeDrawLevelEntrySequence`, one of the many routines called in the busiest code junction in the raster interrupt used during main game play. Even though the game isn't properly 'playing' at this point all of the main game code is running during the entry level sequence though nearly all of it except for this routine exits early as there is nothing for most of the routines to do:

```

; -----
; PerformMainGameUpdate

```

```

JSR UpdateAndAnimateAttackShips
JSR UpdateBulletPositions
JSR DrawUpperPlanetAttackShips
JSR UpdateControlPanelColors
; Jump into KERNAL's standard interrupt service routine to
; handle keyboard scan, cursor display etc.
JMP ReEnterInterrupt
; Returns From Interrupt

```

Listing 5.18: PerformMainGameUpdate the spaghetti junction handling nearly everything during main gameplay. We'll see more of this code section later in the book. During the entry level sequence it is `MaybeDrawLevelEntrySequence` and `PlaySoundEffects` that do most of the work.

`MaybeDrawLevelEntrySequence`'s principal sleight-of-hand is to make it look like it is slowly filling out the surface of the planets when that is precisely what it is doing. Not just to look fancy, but because inverting the tiles of the lower planet takes a bit of CPU time and would result in the player starting a blank screen for quite a long time if we tried to do it all at once.

The routine maintains a counter from 0 to 255 and every time it is visited it increments this counter and uses it to pick part of a tile in the charset to populate. The thing to remember here is that it is not actually painting the planet itself - rather it is slowly filling out the character set containing the tiles that define the textures on the planet. The game already knows which tiles it wants to put where - it just doesn't yet know what they look like. If we maintained separate copies of the upper planet and lower planet tiles we could just give them to the routine and painting would be easy. But because we don't have a copy of the lower planet tiles we have to generate them on the fly and resort to this bit of entry level sequence trickery.

Since there are 8 bytes in each character set definition, each represeting a line in the tile, each visit to this routine updates just one line in one tile. There are 32 tiles in total so 256 visits to the routine during the entry sequence will be enough to fill out the tileset completely. This allows us to fill out the tile set in a random-looking way and is responsible for the materialization effect.

The first part of the `MaybeDrawLevelEntrySequence` is the easy part. We just pick the byte we're going to fill at this visit from a jumbled array of every value between 0 and 255 stored in `source0fSeedBytes`. This jumbled sequence is the source of the random-looking nature of the materialization.

```

MaybeDrawLevelEntrySequence
    LDA levelEntrySequenceActive
    BNE DrawLevelEntrySequence
ReturnFromEntrySequence
    RTS

DrawLevelEntrySequence
    LDX entryLevelSequenceCounter

```

```

; 'Y' becomes our 'random' index into the
; character set definition picking one of its
; 256 bytes to populate a line in one of the tiles.
LDY sourceOfSeedBytes,X

; Pointers to the character set used for the
; current planet.
LDA currentTopPlanetDataLoPtr
STA planetSurfaceDataPtrLo
LDA currentTopPlanetDataHiPtr
STA planetSurfaceDataPtrHi

; The easy part, just copy part of the tile
; for the upper planet to where it needs to go.
LDA (planetSurfaceDataPtrLo),Y
STA upperPlanetSurfaceCharset,Y

INC planetSurfaceDataPtrHi
; Likewise for the character set data used to
; define the heads up display.
LDA (planetSurfaceDataPtrLo),Y
STA upperPlanethUDCharset,Y

JSR InvertSurfaceDataForLowerPlanet

```

Listing 5.19: The start of MaybeDrawLevelEntrySequence. As long as levelEntrySequenceActive is non-zero DrawLevelEntrySequence will run.

This is all just copying and pasting so far. We're slowly populating the tiles for the current upper planet without doing anything computationally intensive. The very last statement is where start work on the lower planet, and that's where the sorcery starts. In InvertSurfaceDataForLowerPlanet we repoint ourselves to the data for the lower planet and use a routine called InvertCharacter to do the actual turning of the byte upside-down:

```

InvertSurfaceDataForLowerPlanet
    LDA currentBottomPlanetDataLoPtr
    STA planetSurfaceDataPtrLo
    LDA currentBottomPlanetDataHiPtr
    STA planetSurfaceDataPtrHi

    ; This is the routine that does the actual inversion.
    ; Everything below and above is managing the copy/paste
    ; of the inverted character into the appropriate position
    ; in lowerPlanetSurfaceCharset.
    JSR InvertCharacter

    LDA invertedCharToDraw
    ; Note that 'X' was updated by InvertCharacter
    STA lowerPlanetSurfaceCharset,X
    INC planetSurfaceDataPtrHi

```

```

; Same as above, but for the charset used in the panel.
JSR InvertCharacter
LDA invertedCharToDraw
; Note that 'X' was updated by InvertCharacter
STA lowerPlanetHUDCharset,X

RTS

```

Listing 5.20: InvertSurfaceDataForLowerPlanet.

The approach taken by InvertCharacter is two-fold: it has to reverse the chosen byte left to right and it also it has to move the byte to its appropriate position in the 8 byte sequence.

0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	1	0	0	0	0	0
0	0	0	0	0	0	1	0

0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0

Figure 5.20: Inverting 00100000 means transforming it to 00001000 and moving it from position 3 in the 8 byte character set definition to position 5.

5.6.1 Flipping the Byte

The first of these requirements is the more elaborate of the two. We need to look at each of the four bit-pairs in the byte and move it to its corresponding 'inverted' position in the byte. So in a way we treat one half of they byte as a mirror of the other and move the bit pair there as in the following examples.

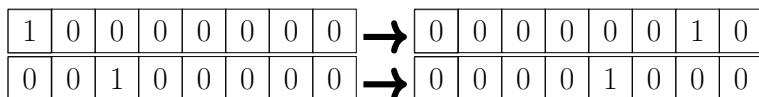

Figure 5.21: Examples of the inversion operation.

The way to do through a combination of bit-shifting and masking. This is what the code responsible looks like. We'll break it down.

```

bitfield1ForInvertingByte .BYTE $00,$40,$80,$C0
bitfield2ForInvertingByte .BYTE $00,$10,$20,$30
bitfield3ForInvertingByte .BYTE $00,$04,$08,$0C

```

```
InvertCharacter
    LDA (planetSurfaceDataPtrLo),Y
    PHA
    AND #$03
    TAX

    ; This part of the routine inverts the byte itself.
    LDA bitfield1ForInvertingByte,X
    STA invertedCharToDraw
    PLA
    ROR
    ROR
    PHA
    AND #$03
    TAX

    LDA bitfield2ForInvertingByte,X
    ORA invertedCharToDraw
    STA invertedCharToDraw
    PLA
    ROR
    ROR
    AND #$03
    TAX

    LDA bitfield3ForInvertingByte,X
    ORA invertedCharToDraw
    STA invertedCharToDraw
    LDA (planetSurfaceDataPtrLo),Y
    ROL
    ROL
    ROL
    AND #$03
    ORA invertedCharToDraw
    STA invertedCharToDraw
```

Listing 5.21: InvertSurfaceDataForLowerPlanet.

Our first step is to take the byte we're interested in from the upper planet character set definition. Let's assume it's the one below.

0	0	0	0	1	0	0	0
---	---	---	---	---	---	---	---

We load this into the accumulator (A) so that we can get work on it. What we're going to do is shift each of the four bit pairs in turn into the rightmost position in the byte and use that value (between 0 and 3) as an index into a trio of helper arrays that give the 'mirrored' bit-pair for that particular position. These helper arrays are `bitfield[1-3]ForInvertingByte`.

We don't have to do any shifting to compare the rightmost bit-pair. We can just AND it

with #\$03 and store the result in X:

```
bitfield1ForInvertingByte .BYTE $00,$40,$80,$C0
InvertCharacter
    LDA (planetSurfaceDataPtrLo),Y
    PHA
    AND #$03
    TAX
```

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$08	0	0	0	0	1	0	0	0
\$03	0	0	0	0	0	0	1	1
Result; \$00	0	0	0	0	0	0	0	0

AND'ing \$08 and \$03 gives \$00.

Since the result is zero, we will then store the value at index zero in bitfield1ForInvertingByte as our result in invertedCharToDraw:

```
bitfield1ForInvertingByte .BYTE $00,$40,$80,$C0

LDA bitfield1ForInvertingByte,X
STA invertedCharToDraw
```

Since our result is zero we've stored zero in invertedCharToDraw.

Now we can move on to the second rightmost bitpair. The ones highlighted in blue below:

We pushed our original value onto the stack using PHA. First we retrieve it using PLA and then shift it two bits to the right:

```
PLA
ROR
ROR
```

When we've done this our byte looks like this, the bitpair we're interested has moved to the rightmost position:

Now we can AND this byte with \$03 again to ensure we only deal with the last two bits (remember that although all the other bits are zero in the example, they may not be in other cases).

```
AND #$03
TAX
```

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$02	0	0	0	0	0	0	1	0
\$03	0	0	0	0	0	0	1	0
Result; \$02	0	0	0	0	0	0	1	0

AND'ing \$02 and \$03 gives \$02.

This result of \$02 gives us an index into `bitfield2ForInvertingByte` which will give us the 'mirrored' bit pair:

```
bitfield2ForInvertingByte .BYTE $00,$10,$20,$30
```

```
LDA bitfield2ForInvertingByte,X
ORA invertedCharToDraw
STA invertedCharToDraw
```

The byte we get from `bitfield2ForInvertingByte` at index 2 is \$20 (remember that indexes always start counting from 0 rather than 1). When we ORA this with our current value for `invertedCharToDraw` we end up with a value of \$20:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$20	0	0	1	0	0	0	0	0
\$00	0	0	0	0	0	0	0	0
Result; \$20	0	0	1	0	0	0	0	0

ORA'ing \$20 and \$00 gives \$20.

As we can see, this has achieved an effective mirroring of our original value!

Figure 5.22: The result of our bit-shifting, AND'ing and ORing.

5.6.2 Flipping the Byte's Position

The remaining steps for the other two bit-pairs in the byte are similar. In the case of our example they will have no effect as the result will be always be zero for them. We've effectively mirrored our bitpair already.

The next and last thing we have to do with our mirrored byte is adjust it's position in the 8 byte sequence in the character definition. In the example below we are dealing with a byte on the left which occurs as the 5th position in the byte sequence and in order to be inverted needs to be moved to the 4th position.

So whereas we were dealing with a left-right mirroring in the byte itself we are now dealing with an up-down mirroring in the position of the byte in its sequence. The total effect of our inversion operation is to flip the character set from left to right and top to bottom:

0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	1	0	0	0	0	0
0	0	0	0	0	0	1	0
1	0	0	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	0	1	0	0

1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	0	0	1	0
1	0	0	0	0	0	0	0
0	0	0	0	1	0	0	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0

Figure 5.23: Flipping the piece both up to down, and left to right.

The second half of `InvertCharacter` that does this looks like:

```

; Now that the byte has been inverted, invert the position in
; the 8 byte charset definition. For example, if the position is
; 0 then the inverted position is 7.

; Mask out everything but the last 3 bits in the current upper
; planet position.
TYA
PHA
AND #$07
TAY
PLA
PHA
AND #$F8
STA charSetDataPtrLo

; Now add the inverted position to get the correct lower planet
; position in the 8-byte charset definition. charSetDataPtrLo is
; just temporary storage here. We store the final value for use
; by the calling routine in 'X' below.

```

```

LDA positionInInvertedCharSet,Y
CLC
ADC charSetDataPtrLo

; By storing the updated position in the charset definition
; to 'X' here, we're changing the offset used in
; lowerPlanetSurfaceCharset in InvertSurfaceDataForLowerPlanet.
TAX

PLA
TAY

```

The key to this operation lies in the use of the array `positionInInvertedCharSet`. If we know that the current byte is number 5 in the 8 byte sequence (i.e. the red row below):

0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	1	0	0	0	0	0
0	0	0	0	0	0	1	0
1	0	0	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0

Figure 5.24: Byte 5 highlighted in red.

then we can use that as an index into `positionInInvertedCharSet` to retrieve the corresponding position in the inverted character set definition. As we can see value of the the 5th byte in `positionInInvertedCharSet` is \$03:

positionInInvertedCharSet	.BYTE \$07,\$06,\$05,\$04,\$03,\$02,\$01,\$00
---------------------------	---

Which as we can see is the appropriate position for the byte in the inverted character set (the 4th byte or red row starting from the top). (Remember that our index into arrays starts at zero, so an index value of zero will pick the first byte and of three, as in this case, will pick the fourth.)

1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	1	0	1	0
1	0	1	0	0	0	1	0
1	0	0	0	0	0	0	0
0	0	0	0	1	0	0	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0

Figure 5.25: Byte 5 when flipped.

So where do we get the position of the current byte in the uninverted character set? This was passed into `InvertSurfaceDataForLowerPlanet` and `InvertCharacter` in the Y register. It's a value between 0 and 256 which references the offset of the current byte in the character set data as a whole so all we have to do is clamp it to a value between 0 and 7 to get the value we need within the 8-byte definition for this specific character.

```
; Mask out everything but the last 3 bits in the current upper
; planet position.
TYA
PHA
AND #$07
```

The clamping is achieved by the AND statement. If we imagine that Y has a value of \$D4, we transfer it to the A register (TYA and then do an AND operation with \$07:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$D4	1	1	0	1	1	0	0	0
\$07	0	0	0	0	1	1	1	1
Result: \$04	0	0	0	0	1	0	0	0

AND'ing \$D4 and \$07 gives \$04.

This gives us \$04 as a result, which as we saw returns \$03 when used as an index into `positionInInvertedCharSet`.

With our new position for the byte in the character set definition established we can store it to the X register and use that as the position in `lowerPlanetSurfaceCharset` where we will store the `invertedCharToDraw` we calculated earlier. We do this when we return from the `InvertCharacter` routine and are back in `InvertSurfaceDataForLowerPlanet`:

```
JSR InvertCharacter
LDA invertedCharToDraw
; Note that 'X' was updated by InvertCharacter
STA lowerPlanetSurfaceCharset,X
```

With that done, we've added another brick in the wall. Or more precisely, another byte in the 256 that in total make up the tileset for the upper and lower planets respectively. As the materialization sequence proceeds we slowly fill out the tileset byte-by-byte. After a few seconds we've successfully cheated our way into generating the lower planet's tileset on the fly into lowerPlanetSurfaceCharset and the game is ready to play.

Figure 5.26: The planets when we start the materialization sequence, and when we end.

Blasting, Fast and Slow

Every game has a 'main loop', a tight section of code which is executed multiple times per second and which controls nearly all aspect of the gameplay. Iridis Alpha is a game and since we've just finished preparing the planets for our game it may be time to do some main looping so the player can do some playing. The boiler-room in which the game runs is called PerformMainGameUpdate:

```
;-----  
; PerformMainGameUpdate  
;  
PerformMainGameUpdate  
    LDX currentPlanetBackgroundClr1  
    LDA backgroundColorsForPlanets,X  
    STA $D022      ;Background Color 1, Multi-Color Register 0  
    LDX currentPlanetBackgroundClr2  
    LDA backgroundColorsForPlanets,X  
    STA $D023      ;Background Color 2, Multi-Color Register 1  
  
    LDA $D01F      ;Sprite to Background Collision Detect  
    STA spriteCollidedWithBackground  
  
    JSR CheckKeyboardInGame  
    JSR ScrollStarfieldAndThenPlanets  
    JSR AnimateGilbySpriteMovement  
    JSR PerformMainGameProcessing  
    JSR CheckForLandscapeCollisionAndWarpThenProcessJoystickInput  
    JSR CalculateGilbyVerticalPositionEarthBound  
    JSR CalculateGilbyVerticalPositionAirborne  
    JSR MaybeDrawLevelEntrySequence  
    JSR PlaySoundEffects  
    JSR FlashBorderAndBackground  
    JSR UpdateGilbyPositionAndColor  
    JSR UpdateAndAnimateAttackShips  
    JSR UpdateBulletPositions  
    JSR DrawUpperPlanetAttackShips
```

```

JSR UpdateControlPanelColors
; Jump into KERNAL's standard interrupt service routine to
; handle keyboard scan, cursor display etc.
JMP ReEnterInterrupt
; Returns From Interrupt

```

Listing 6.1: PerformMainGameUpdate. This is the spaghetti junction handling nearly everything during main gameplay.

Just like in the title sequence this routine is called dozens of times as the beam of light painting the screen travels from top to bottom up to 25 times per second. `PerformMainGameUpdate`, along with a routine called `AnimateStarFieldAndScrollPlanets` whose purpose you can hopefully guess from its name, are the two gears that grind out the gameplay as long as the player is alive and blasting.

For each pass through the screen `AnimateStarFieldAndScrollPlanets` is executed 8 times while `PerformMainGameUpdate` is executed once.

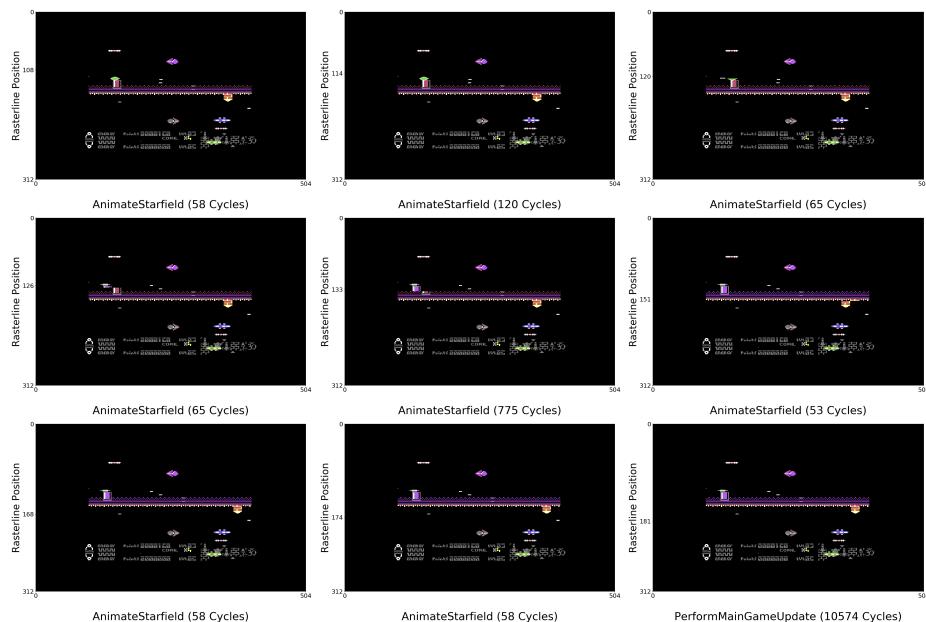

Figure 6.1: The rasterline position when `AnimateStarFieldAndScrollPlanets` and `PerformMainGameUpdate` are called.

If you look closely you'll notice that `PerformMainGameUpdate`, our so-called boiler-room routine, is called last, when the raster is nearing the end of the screen. This makes sense as it has the most to do and therefore we need to execute it at a point when

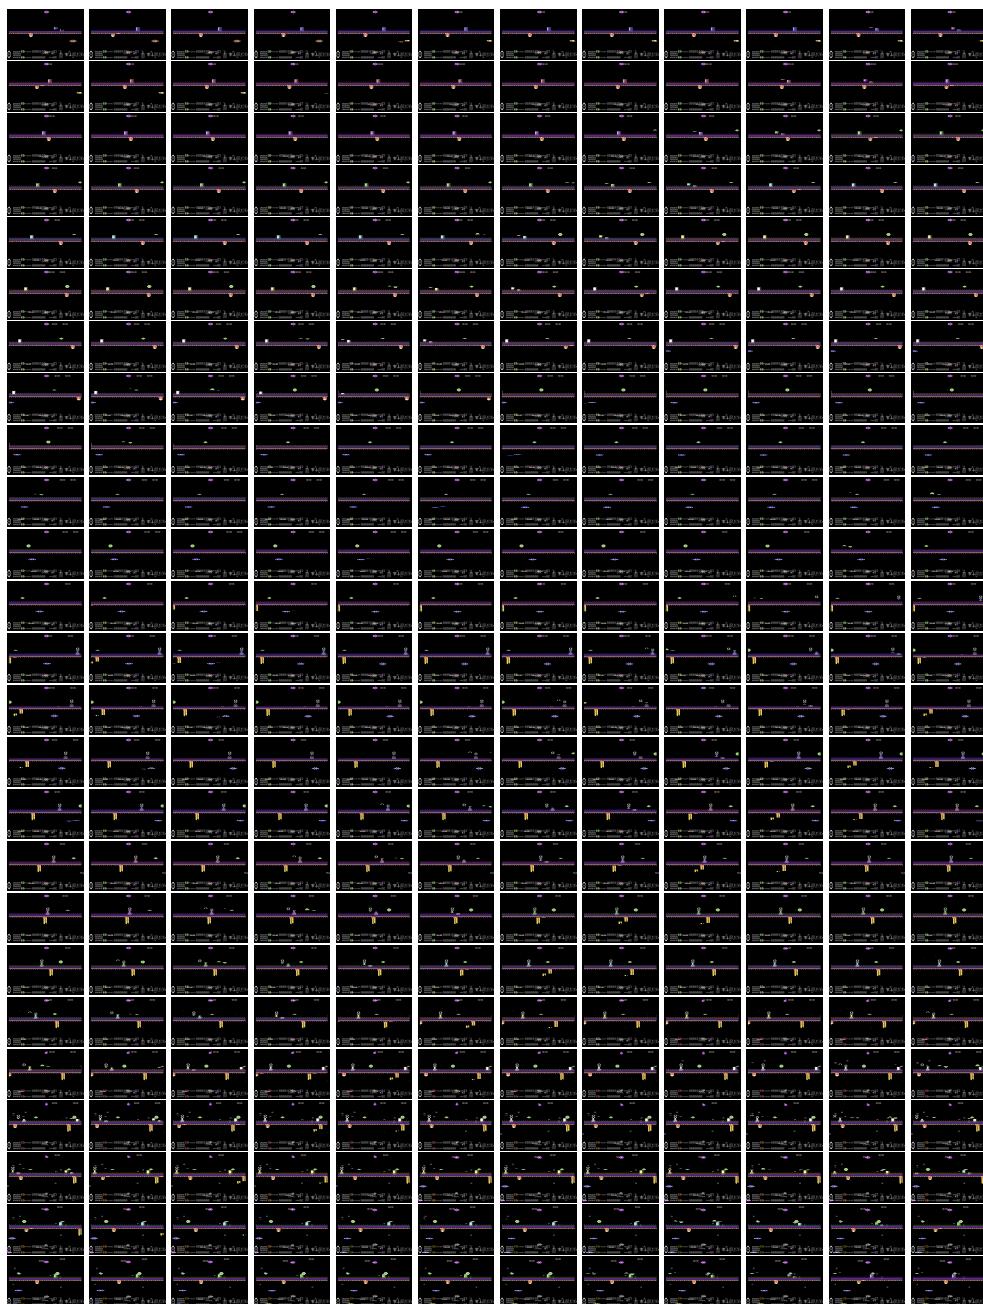

Figure 6.2: The screens displayed in a single second of game time.

most of the screen has been painted and what to paint on the rest of it has already been prepared. PerformMainGameUpdate primarily concerns itself with preparing the screen for the next time it will be painted: updating the position of the enemies on the upper planet, the position of the player's ship, playing sound effects, moving the bullets and so on.

AnimateStarFieldAndScrollPlanets on the other hand only has to worry about painting the parallax starfield in the background, scrolling the planets using the C64's specialized hardware, and preparing the position of the enemy sprites on the lower planet. The only reason it is called more than once is because, like in the title screen routine, the starfield is being painted using a single sprite (Sprite 7). Each time it runs it can change the position of this sprite so that it appears at a new position as well as the old one on which the raster has already painted it. We covered the mechanics of this in detail when we dissected the title screen in 'The First 16 Milliseconds'.

6.1 Updating Enemy Sprite Positions

We can get a better sense of how the labour is divided between the two routines if we isolate the position of the raster when the position of the enemy sprites on each planet is updated.

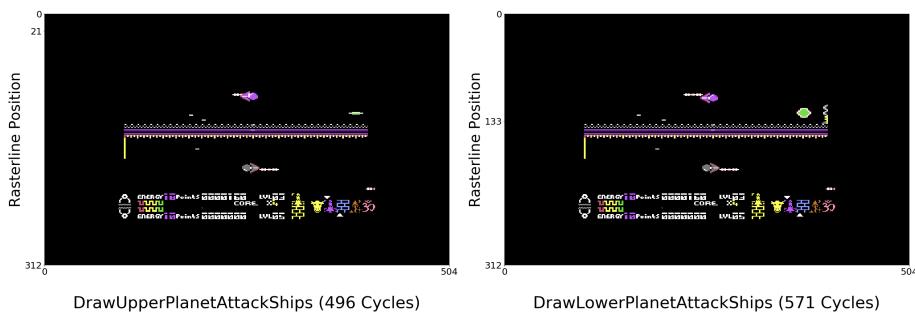

Figure 6.3: The rasterline position when the enemies on the upper and lower planets are updated.

Notice how the upper planet's attack ships are drawn when the raster is near the top of the screen, while those for the lower planet are drawn when the raster reaches line 135, exactly half-way down the screen, just in time for them to be painted when the raster passes through the lower half of the screen.

The routines for updating the sprites on the upper and lower planets are identical. If we were writing this game in any other language than assembly we would just have

one function and pass the different arrays for each planet in as parameters.

```

DrawUpperPlanetAttackShips
    LDX #$0C
    LDY #$06
UpperPlanetShipsLoop
    LDA upperPlanetAttackShipsXPosArray,Y
    STA $D000,X ;Sprite 0 X Pos

    LDA attackShipsXPosArray - $01,Y
    AND $D010 ;Sprites 0-7 MSB of X coordinate
    STA currentMSBXposOffset

    LDA upperPlanetAttackShipsMSBXPosArray,Y
    AND attackShipsMSBXPosOffsetArray,Y
    ORA currentMSBXposOffset
    STA $D010 ;Sprites 0-7 MSB of X coordinate

; The X-Pos of sprites is fiddly. The MSB manages
; which side of the 512 possible x positions they
; are on.
    LDA upperPlanetAttackShipsYPosArray,Y
    STA $D001,X ;Sprite 0 Y Pos
    STX tempVarStorage

    LDX upperPlanetAttackShipsColorArray,Y
    LDA colorsForAttackShips,X
    STA $D027,Y ;Sprite 0 Color

    LDA upperPlanetAttackShipsSpriteValueArray,Y
    STA Sprite0Ptr,Y
    LDX tempVarStorage

    DEX
    DEX
    DEY
    BNE UpperPlanetShipsLoop
    RTS

```

```

DrawLowerPlanetAttackShips
    LDX #$0C
    LDY #$06
LowerPlanetShipsLoop
    LDA lowerPlanetAttackShipsXPosArray + $01,Y
    STA $D000,X ;Sprite 0 X Pos

    LDA attackShipxXPosArray - $01,Y
    AND $D010 ;Sprites 0-7 MSB of X coordinate
    STA currentMSBXPosOffset

; The X-Pos of sprites is fiddly. The MSB manages
; which side of the 512 possible x positions they
; are on.
    LDA lowerPlanetGilbyBulletMSBXPosValue,Y
    AND attackShipxMSBXPosOffsetArray,Y
    ORA currentMSBXPosOffset
    STA $D010 ;Sprites 0-7 MSB of X coordinate

    LDA lowerPlanetAttackShipsYPosArray,Y
    STA $D001,X ;Sprite 0 Y Pos
    STX tempVarStorage

    LDX lowerPlanetAttackShipsColorArray,Y
    LDA colorsForAttackShips,X
    STA $D027,Y ;Sprite 0 Color

    LDA lowerPlanetAttackShipsSpriteValueArray,Y
    STA Sprite0Ptr,Y
    LDX tempVarStorage

    DEX
    DEX
    DEY
    BNE LowerPlanetShipsLoop
    RTS

```

But here, duplication is both convenient and sensible. Trying to abstract away the differences and use a single routine would make things unnecessarily complicated. After all, no one will ever read this code, right? Right?

6.2 Scrolling the Planets

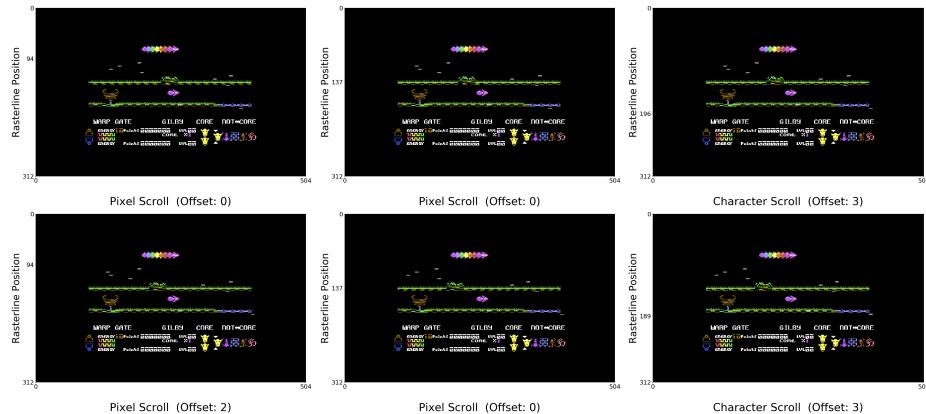

We want scrolling to be smooth and fast. Moving swiftly or slowly across the planet surface depending on how much acceleration we apply is the fundamental dynamic of the game so will be important to get right.

Exerting some fine-grained control on the scrolling requires us to balance two fundamental operations: a pixel-by-pixel scrolling mechanism that preserves the smoothness of movement we want at slower speeds, and a bigger, blunter implement that will accelerate us across larger sections of the planet while preserving an illusion of relative fluidity.

The first is available as a hardware implementation on the C64. The value stored in the last three bits of \$D016 allows us to specify a pixel offset for the planet graphics between 0 and 7, effectively shifting the planet left or right by one or more pixels.

The second is up to us. We need to keep an eye on the speed of our gilby and decide if we should shift the landscape by one or more full characters.

Here are both of these tactics in operation during two paints of the screen while we're warping into the Sheep planet at the start of a new game. Each row represents a single pass of the raster. As you can see we adjust the pixel position using \$D016 twice on each pass and adjust the character position once.

Since we're moving fairly fast, we're updating the character position by 3 characters on each occasion (notice how much the bush moves). At the same time we're applying a pixel movement to preserve the impression of smoothness.

6.2.1 Pixel Movement

If we look at the code that looks after the pixel-grained movement in `AnimateStarFieldAndScrollPlanets` we can see it is using a variable called `planetScrollSpeed` to control the amount of offset to apply:

```
; Scroll the planet
LDA $D016      ;VIC Control Register 2
AND #$F0
ORA planetScrollSpeed
ORA #$10
STA $D016      ;VIC Control Register 2
```

This parameter is always kept to a value between 0 and 7, for example here in `DrawPlanetScroll` where it gets clamped to the last 3 bits (Bits 0 to 2) by an AND operation:

```
LDA planetScrollSpeed
AND #$07
STA planetScrollSpeed
```

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$FC	1	1	1	1	1	1	0	0
\$07	0	0	0	0	0	1	1	1
Result:	\$04	0	0	0	0	1	0	0

AND'ing a notional value of \$FC with \$07 gives \$04.

As you might guess, planetScrollSpeed is controlled by the speed of the gilby itself:

```
LDA planetScrollSpeed
CLC
ADC currentGilbySpeed
STA planetScrollSpeed
```

The more we push on the joystick left or right the greater currentGilbySpeed becomes. The greater currentGilbySpeed becomes, the more we add to planetScrollSpeed. The only thing we have to be careful about when using this simple mechanic is to ensure that when we update \$D016 with planetScrollSpeed we are only updating the lower 3 bits - writing to the rest of them will break things as they are not concerned with scrolling at all. This is why, when we first retrieve \$D016 to the A register we mask out the first four bits:

```
; Scroll the planet
LDA $D016      ;VIC Control Register 2
AND #$F0
```

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$DE	1	1	0	1	1	1	1	0
\$F0	1	1	1	1	0	0	0	0
Result:	\$D0	1	1	0	1	0	0	0

AND'ing a notional value of \$DE with \$F0 gives \$D0 preserving the first 4 bits (D).

ORA'ing a notional value for planetScrollSpeed of \$06 with \$D0 gives \$D6, adding our planetScrollSpeed into \$D0 without disturbing what was already there:

```
ORA planetScrollSpeed
```

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$D0	1	1	0	1	0	0	0	0
\$06	0	0	0	0	0	1	1	0
Result: \$D6	1	1	0	1	0	1	1	0

Finally, ORA #\$10 ensures that the multi-color mode bit in \$D016 is set:

```
ORA #$10
STA $D016      ;VIC Control Register 2
```

So in a nutshell we're not being too fussy about what value we select for the pixel-perfect offset. We just take the overall scroll speed and clamp it to a value between 0 and 7. This is 'good enough' in practice - it ensures we're avoiding the appearance of scrolling purely character-wise by guaranteeing we're nearly always displaying the surface offset by some small number of pixels.

6.2.2 Character Movement

As a quick reminder from our chapter on generating the surfaces of the planets ('Making Planets for Nigel'), the data we came up with for the ever-so-randomly-generated planet was stored between \$8000 and \$8FFF.

```
; Clear down the planet surface data from $8000 to $8FFF.
; There are 4 layers:
; Top Layer:   $8000 to $83FF - 1024 bytes
; Second Layer: $8400 to $87FF - 1024 bytes
; Third Layer:  $8800 to $8BFF - 1024 bytes
; Bottom Layer: $8C00 to $8FFF - 1024 bytes
LDY #$00
ClearPlanetHiPtrs
; $60 is an empty character and gets written to the entire
; range from $8000 to $8FFF.
LDA #$60
ClearPlanetLoPtrs
STA (planetSurfaceDataPtrLo),Y
DEY
BNE ClearPlanetLoPtrs
INC planetSurfaceDataPtrHi
LDA planetSurfaceDataPtrHi
CMP (#>planetSurfaceData) + $10
BNE ClearPlanetHiPtrs
```

Listing 6.2: The surface data is stored from \$8000 to \$8FFF. This code overwrites it all with the value \$60 which is an empty bitmap.

As you can see in the code comment above the planet surface itself is 1024 bytes long

and we store 4 layers of 1024 bytes each. The bottom layer is the surface, the other three are used for filling in the structures that dot the planet's surface.

When we initialize the game we use a bunch of pointers to store the position of each of these layers:

```
; The planet data starts at $8000. Each planet
; has 4 lines or layers.
LDA #>planetOneTopLayer
STA planetTextureTopLayerPtrHi
LDA #>planetOneSecondFromTopLayer
STA planetTextureSecondFromTopLayerPtrHi
LDA #>planetOneSecondFromBottomLayer
STA planetTextureSecondFromBottomLayerPtrHi
LDA #>planetOneBottomLayer
STA planetTextureBottomLayerPtrHi
```

Every time we scroll by one or more characters along the planet surface, updating what we see on the screen will just be a simple question of calling a routine called DrawPlanetSurfaces to write wherever in each layer the current pointer is pointing to:

```
DrawPlanetSurfaces
    ...
    ;Draw the upper and lower planets. The lower
    ;planet is a mirror image of the top.
    LDX #$27
Loop   LDA (planetTextureTopLayerPtr),Y
        STA SCREEN_RAM + LINE7_COL0,Y
        ORA #$CO
        STA SCREEN_RAM + LINE15_COL0,X
        LDA (planetTextureSecondFromTopLayerPtr),Y
        STA SCREEN_RAM + LINE8_COL0,Y
        ORA #$CO
        STA SCREEN_RAM + LINE14_COL0,X
        LDA (planetTextureSecondFromBottomLayerPtr),Y
        STA SCREEN_RAM + LINE9_COL0,Y
        ORA #$CO
        STA SCREEN_RAM + LINE13_COL0,X
        LDA (planetTextureBottomLayerPtr),Y
        STA SCREEN_RAM + LINE10_COL0,Y
        ORA #$CO
        STA SCREEN_RAM + LINE12_COL0,X
        INY
        DEX
        CPY #$28
        BNE Loop
        RTS
```

So all we have to do as we scroll along the planet is adjust the position in RAM between \$8000-\$83FF that planetTextureTopLayerPtr is pointing to (and the same for the

other layers) and we will effect the illusion of movement across the surface of the planet.

This means that our job is a simple one: how many characters should we move along the planet?

This decision happens in the `ScrollPlanets` routine, inside the `PerformMainGameUpdate` loop. As we have seen earlier, this routine is called around the time the raster reaches just past the halfway point down the screen:

Figure 6.4: The rasterline position at 196 when `ScrollPlanets` is called.

Just like with calculating the more fine-grained pixel offset we used `planetScrollSpeed` to determine how much to move by. But whereas the pixel movement used the lower 3 bits of `planetScrollSpeed` to come up with a value between 0 and 7 to adjust the pixel scroll by, we will here instead use the 3 bits before that.

The reason for doing that is straightforward: if those upper 3 bits are set the number in `planetScrollSpeed` must be fairly large and therefore enough to warrant scrolling an entire character or even more.

In a situation where we're moving to the right, this is the logic that figures out how many characters to move and updates `planetTextureTopLayerPtr` with the updated position:

```
ScrollPlanetRight
    LDA planetScrollSpeed
    EOR #$FF
    CLC
    AND #$F8
    ROR
    ROR
    ROR
```

```

STA tempHiPtr1
INC tempHiPtr1
LDA planetTextureTopLayerPtr
CLC
ADC tempHiPtr1
STA planetTextureTopLayerPtr

```

This is more complicated than we actually had reason to expect. Surely if the value in `planetScrollSpeed` is greater than 7 we could just shift the bits over there and use that instead? For example with a notional value of \$1F in `planetScrollSpeed` if we just did the following:

```

ScrollPlanetRight
    LDA planetScrollSpeed
    AND #$F8
    ROR
    ROR
    ROR

```

We would get a value of \$03 for our number of characters to move by. This is because AND'ing \$1F and \$F8 gives us \$18:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$1F	0	0	0	1	1	1	1	1
\$F8	1	1	1	1	0	0	0	0
Result: \$18	0	0	1	1	0	0	0	0

And then using `ROR` to shift the bits to the right three times results in \$03:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$18	0	0	1	1	0	0	0	0
Result: \$03	0	0	0	0	0	0	1	1

Figure 6.5: `ROR` performed three times shifts everything to the right by three bits.

But instead of this we're doing an exclusive-or with the value in `planetScrollSpeed` first:

```

ScrollPlanetRight
    LDA planetScrollSpeed
    EOR #$FF

```

The reason we have to do this is because the value in `planetScrollSpeed` isn't what

we might have assumed: a linear value between 0 and 40 for example that goes up and down a sliding scale depending on how fast we're going. Instead, it's something slightly different. It's fed by the value in `currentGilbySpeed` that reflects the current velocity of the gilby and this always starts out at a value of \$EA:

```
SetUpGilbySprite
    LDA #GILBY_AIRBORNE_RIGHT
    STA currentGilbySprite
    ..
    LDA #$EA
    STA currentGilbySpeed
    ..
    RTS
```

There's a trick at work here. The gilby can move left or right and `currentGilbySpeed` is being used to store both the speed *and* direction of the gilby. When the value is between 00 and 80 the gilby is moving to the left and the value reflects its relative velocity. When the value is between 80 and FF the gilby is moving to the right and the value reflects its relative velocity.

When Moving Left	Stationary	When Moving Right
\$04 \$03 \$02 \$01	\$00	\$FF \$FE \$FD \$FC

Figure 6.6: Value of `currentGilbySpeed` when moving left and right.

Sure enough, when we look at the calculation using for the character scroll offset when moving left, it's what we originally envisaged:

```
ScrollPlanetLeft
    LDA planetScrollSpeed
    CLC
    ADC currentGilbySpeed
    STA planetScrollSpeed
    ..
    CLC
    ROR
    ROR
    ROR
    STA tempHiPtr1

    LDA planetTextureTopLayerPtr
    SEC
    SBC tempHiPtr1
```

So the extra steps we see in `ScrollPlanetRight` are to handle the fact that the speed is going to be some value between \$80 and \$FF. The exclusive-or (`EOR`) has the effect of

reversing the value in `planetScrollSpeed` and transforming it into a number between 0 and 16 that we can then clamp to a number between 0 and 7.

```
ScrollPlanetRight
    LDA planetScrollSpeed
    EOR #$FF
    CLC
    AND #$F8
    ROR
    ROR
    ROR
    STA tempHiPtr1
    INC tempHiPtr1
    LDA planetTextureTopLayerPtr
    CLC
    ADC tempHiPtr1
    STA planetTextureTopLayerPtr
```

6.3 Jumping Up and Down

```
; -----
; PerformMainGameUpdate
; -----
PerformMainGameUpdate
    ...
    JSR CalculateGilbyVerticalPositionEarthBound
    JSR CalculateGilbyVerticalPositionAirborne
    ...
```

Listing 6.3: The routines responsible for updating the Gilby's vertical position.

When the gilby jumps on the surface of the planet it exhibits a smooth and pleasing acceleration in ascent and descent that eloquently suggests the gravity of the planet. This is achieved with a remarkably simple mechanism. Rather than define distinct behaviours for the journey upwards and the journey back, we use a single continuous movement based on incrementing the gilby's vertical position with an offset that 'cycles around' and transitions naturally from ascent to descent.

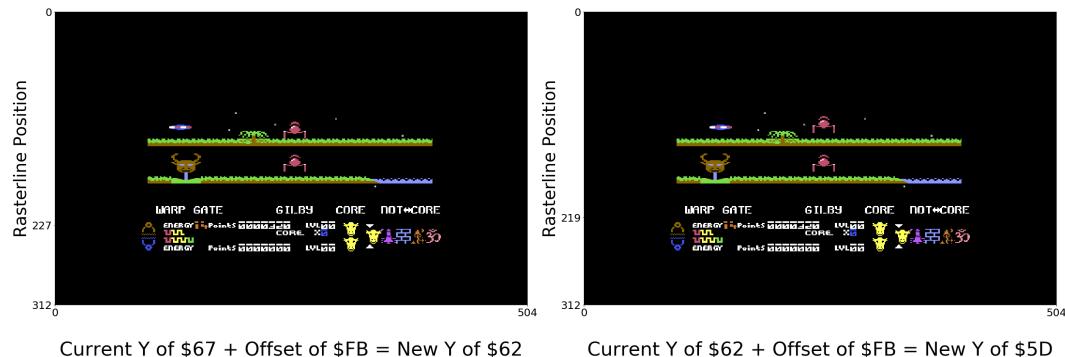

Achieving the complementary movements of ascent and descent with the same operation depends on a simple property of byte values when we increment them. If we keep adding to a value and it eventually reaches the maximum value of 255 (i.e. `$FF`) that can be stored in a single byte, the next time we add 1 to it it will cycle around to `$00`. So if we add `$FB`, for example, to `$09` we get `$05`.

So let's take our starting vertical position (our Y co-ordinate) on the planet to be `$6D`. This is the Y-coordinate on the screen that coincides with the surface of the planet.

If we're planning to move upwards we might think that the natural number to subtract from this position to move us up the screen is something like 3 or 4. And then when we're moving down the screen later on we would increment this position value by 3 or 4, or some smaller number depending on how quickly we want to move. This intuition is correct, up to a point, but it would mean keeping track of which direction we're going and complicate our code.

Given the circular property of byte arithmetic we described above we can increment or decrement our position by simply adding a carefully chosen value. If we add a number that will force the result to cycle around and come out less than the current Y value then we've successfully subtracted from Y while adding to it! This is the essence of our trick.

If we choose our offset value (`gilbyLandingJumpingAnimationYPosOffset`) as \$FB and add it to our current Y co-ordinate of \$67 we get a result of \$62: we move the gilby up the screen by five pixels:

This is what the code achieving this effect looks like:

```
UpdateGilbyPosition
    CLC
    ADC gilbyLandingJumpingAnimationYPosOffset
    STA gilbyVerticalPositionUpperPlanet

    ; Check if we've hit the surface.
    AND #$F0
    CMP #YPOS_PLANET_SURFACE + $03
    BNE StorePositionAndReturn

    LDA #YPOS_PLANET_SURFACE
    STA gilbyVerticalPositionUpperPlanet

StorePositionAndReturn
```

```
; Update the position on screen.
LDA gilbyVerticalPositionUpperPlanet
STA $D001      ;Sprite 0 Y Pos
RTS
```

Our choice of \$FB as an initial value for the offset is very deliberate. As we increment this offset it will eventually reach \$FF. Each time we do so the resulting degree in movement it creates gets smaller. So the gilby will appear to move quickly at first but slow down the further it gets from the planet:

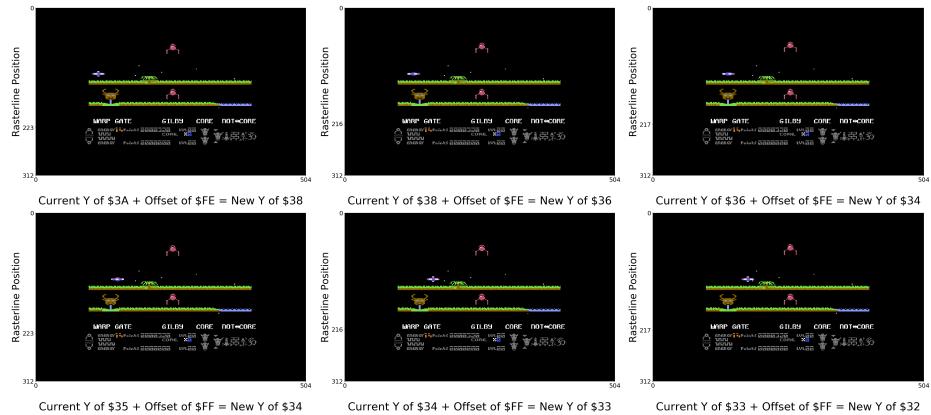

Figure 6.7: Each increment in the offset, performed every three movements, results in a deceleration effect.

When our offset value `gilbyLandingJumpingAnimationYPosOffset` reaches `$FF` it is time for modular arithmetic to kick in the next time we increment it: the movement-increment it gives us is `$00` and for the next three 'movements' the gilby appears to hang in the sky at Y co-ordinate `$33`:

Now that `gilbyLandingJumpingAnimationYPosOffset` is `$00` adding it to our current Y position will no longer have the effect of cycling around and arriving at a smaller value than the current Y position. Instead it will increment the Y position and move the gilby down the screen again. Just as when we were moving upwards the resulting movement increases in degree as we get closer to the land, creating an acceleration effect due to gravity.

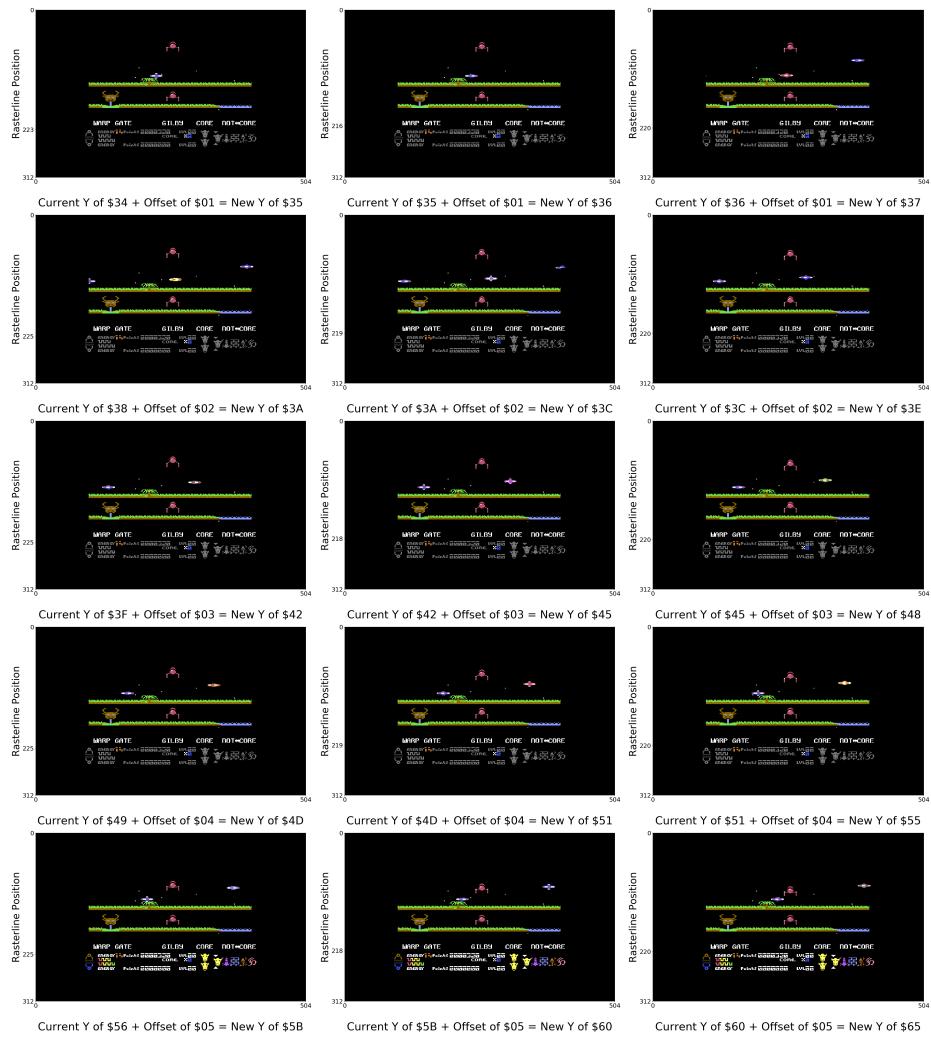

Figure 6.8: Each increment in the offset, performed every three movements, results in an acceleration effect.

With a simple, consistent addition operation, each time it comes to position the gilby we've managed to achieve a jumping and landing effect with a neat gravity effect built in!

6.4 Sound Effects

```

; -----
; PerformMainGameUpdate
; -----
PerformMainGameUpdate
    ...
    JSR PlaySoundEffects
    ...

```

Iridis Alpha has a rich weave of sound effects during play. The game is as much an assault on the ears as it is on the eyes. In order to create the impression that there are multiple sounds going on at once so it is necessary to... have multiple sounds going at once. The fancy word for this is 'multiplexing'. If we want the player to experience the world of Iridis Alpha as one in which things are not happening sequentially but simultaneously we will need the sounds they experience to interleave with each other, rather than just playing whatever the 'current' sound is then waiting for it to finish before we play the next. Playing two sounds at once is more than enough multiplexing to be going on with, so that is what we do.

The way to achieve this is to come up with a data structure for sound effects that segments the full sound effect into multiple frames and to process a few frames of each data structure every time `PlaySoundEffects` is called by the raster interrupt. We also need `PlaySoundEffects` to behave like a 'state machine'. This means that when it is called a little later it can pick up from where it left off on each data structure, recognize when it has finished playing the frames for that interrupt and also when it has finished playing the full effect. This will allow us to manage two different sound effects concurrently. Before we look at how this multiplexing is achieved lets look at how a single sound effect is managed in general.

6.4.1 The Sound Effect Data Structure

As ever, the key to managing complexity isn't the cleverness of our code but the simplicity of the data structure we choose. Iridis Alpha solves this with a remarkably compact solution where each frame in the sound effect is represented by a meagre 5 bytes and the whole sound effect is encoded by a sequence of these 5-byte records. In order to unpack what this looks like in practice, let's look at the iconic effect played when we enter a new planet. The data structure here is just one part of the level entry sound effect, the duller part. It plays a dull bass note that fades away. (We'll examine the more interesting leg of the overall sound effect, the one that it's multiplexed with, right after this. But this is a relatively nice and simple one for us to get an idea of how the data structure works.)

```

PLAY_SOUND = $00
PLAY_LOOP = $05
LINK = $80
VOICE2_HI = $08
VOICE2_CTRL = $0B
VOICE3_HI = $0F
VOICE2_ATK_DEC = $0C
VOICE2_SUS_REL = $0D
VOICE3_CTRL = $12
VOICE3_ATK_DEC = $13
VOICE3_SUS_REL = $14
planetWarpSoundEffect .BYTE $00,PLAY_SOUND,$0F,VOICE2_ATK_DEC,$00
                     .BYTE $00,PLAY_SOUND,$0F,VOICE3_ATK_DEC,$00
                     .BYTE $00,PLAY_SOUND,$0F,VOLUME,$00
                     .BYTE $00,PLAY_SOUND,$00,VOICE2_SUS_REL,$00
                     .BYTE $00,PLAY_SOUND,$00,VOICE3_SUS_REL,$00
                     .BYTE $00,PLAY_SOUND,$03,VOICE2_HI,$00
                     .BYTE $00,PLAY_SOUND,$03,VOICE3_HI,$00
                     .BYTE $00,PLAY_SOUND,$21,VOICE2_CTRL,$00
                     .BYTE $00,PLAY_SOUND,$08,VOICE3_LO,$00
                     .BYTE $00,PLAY_SOUND,$00,VOICE2_LO,$00
                     .BYTE $00,PLAY_SOUND,$21,VOICE3_CTRL,$01
                     .BYTE $18,PLAY_LOOP,$00,<pwLoop,>pwLoop
                     .BYTE $00,PLAY_SOUND,$20,VOICE2_CTRL,$00
                     .BYTE $00,PLAY_SOUND,$20,VOICE3_CTRL,$00
                     .BYTE $00,LINK,<setVolToMax,>setVolToMax,$00
pwLoop

```

This data is like a piano roll fed into PlaySoundEffects. In simplified terms each line is a 'frame' containing a single note for it to play. For the lines with PLAY_SOUND it really is that simple. Byte 3 in each of those lines is the 'note' to play, and Byte 4 (e.g. VOICE2_ATK_DEC) is the 'key on the piano' to play it on. PlaySoundEffects will keep playing each line in the roll until it hits one with a value in Byte 5 that is not \$00. In this case that happens when it hits the line that starts with pwLoop, notice the \$01 at the very end.

Let's be more concrete about what's happening when each PLAY_SOUND record is processed as it's quite simple. The value in Byte 3 is written to the position in the SID register given by Byte 4. The SID register is an array of bytes in the C64's ROM that controls the production of sound and they live between addresses \$D400 and \$D418. So in the first record in planetWarpSoundEffect we are going to write \$0F to the address \$D40C in the SID register.

What does that do you might ask? Does it play a note? Well, no, as it happens this address in the SID register is responsible for controlling how much a sound rises or falls. As you can see in the visualization of the effect below it decays away. This byte we're setting is responsible for setting that on 'Voice 2' in the sound chip.

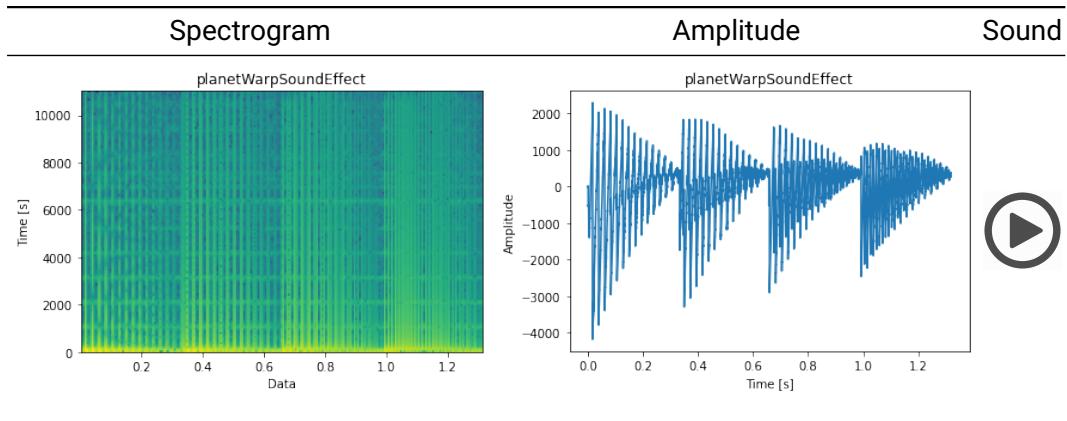

Figure 6.9

The next record does the same for 'Voice 3'. The one after that sets the volume (\$D418) to its maximum value of 15 (\$0F).

```
.BYTE $00, PLAY_SOUND,$0F, VOICE3_ATK_DEC,$00
.BYTE $00, PLAY_SOUND,$0F, VOLUME,$00
```

The next two records ensure Voices 2 and 3 do not sustain their sound by writing \$00 to both. We just want them to die away quickly after all.

```
.BYTE $00, PLAY_SOUND,$00, VOICE2_SUS_REL,$00
.BYTE $00, PLAY_SOUND,$00, VOICE3_SUS_REL,$00
```

Finally we can start playing some notes.

```
.BYTE $00, PLAY_SOUND,$03, VOICE2_HI,$00
.BYTE $00, PLAY_SOUND,$03, VOICE3_HI,$00
```

What we are doing here is writing a frequency value to SID registers for Voice 2 and Voice 3 that will actually make some noise. We then tell the sound device to start playing the note by setting its 'gate' to 1. The 'gate' is the 'least significant bit', i.e. the 1 in the \$21 given in Byte 3:

```
.BYTE $00, PLAY_SOUND,$21, VOICE2_CTRL,$00
```

After adjusting the sound again:

```
.BYTE $00, PLAY_SOUND,$08, VOICE3_LO,$00
```

```
.BYTE $00, PLAY_SOUND, $00, VOICE2_LO, $00
```

We now encounter the use of a new record type called PLAY_LOOP.

```
VOLUME = $18
pwLoop      .BYTE $00, PLAY_SOUND, $21, VOICE3_CTRL, $01
            .BYTE VOLUME, PLAY_LOOP, $01, <pwLoop, >pwLoop
```

What this this particular instance of a PLAY_LOOP record does is gradually lower the volume until it reaches zero.

More generally the way PLAY_LOOP records are processed is as follows. First of all we write to the offset in the SID register given by Byte 1 (in this case the register responsible for volume). The value we write is also derived from Byte 1, but by using it as an index into an array called soundEffectBuffer:

```
soundEffectBuffer .BYTE $00, $94, $00, $00, $11, $0F, $00, $00
                  .BYTE $03, $00, $00, $21, $0F, $00, $08, $03
                  .BYTE $00, $00, $21, $0F, $00, $00, $00, $00
                  .BYTE $02, $00, $00, $00, $00, $00, $00, $00
```

If we look at our record again..

```
.BYTE VOLUME, PLAY_LOOP, $01, <pwLoop, >pwLoop
```

we can see Byte 1 is VOLUME, which is an alias for the value \$18. Using \$18 as an index into soundEffectBuffer retrieves the fourth value on the third line above, \$0F. We then subtract the value in Byte 3 (\$01) and store the result back in the soundEffectBuffer. If it's not zero yet, we then treat the record pointed to by Bytes 4 and 5 as the next one to play. In this case that's given as pwLoop. So in fact we go round in a loop between the two records until \$0F eventually becomes zero. Here's the code that handles this:

```
LDX soundEffectDataStructure_Byte1
LDA soundEffectBuffer, X
SEC
SBC soundEffectDataStructure_Byte3

StorePointersAndReturnIfZero
STA soundEffectBuffer, X
STA $D400, X ;Voice 1: Frequency Control - Low-Byte
BEQ JumpToGetNextRecordInSoundEffect
LDA soundEffectDataStructure_Byte4
LDX indexToPrimaryOrSecondarySoundEffectPtr
STA primarySoundEffectLoPtr, X
LDA soundEffectDataStructure_Byte5
STA primarySoundEffectHiPtr, X
RTS
```

```
JumpToGetNextRecordInSoundEffect
    JMP GetNextRecordInSoundEffect
```

You can see that once we reach zero BEQ `JumpToGetNextRecordInSoundEffect` becomes true and we end up calling `GetNextRecordInSoundEffect` which actually lets us move on to the next record in our data structure (the two we've just looped through are given at the start to make it easier to see where picked up from):

```
.BYTE $00,PLAY_SOUND,$20,VOICE2_CTRL,$00
.BYTE $00,PLAY_SOUND,$20,VOICE3_CTRL,$00
```

You can see we write \$20 to `VOICE2_CTRL` and `VOICE3_CTRL`. This stops the noise we were making until now. It switches off the sound by setting the 'gate' we set to 1 earlier on back to 0.

The final record we play is a simple 'jump' record. Its processed by simply jumping to the address given in Bytes 4 and 5 and playing whatever is there:

```
.BYTE $00,LINK,<setVolToMax,>setVolToMax,$00
```

In this case it is pointing us to the data structure at `setVolToMax`. This simply runs in a loop setting the volume back to \$0F, i.e. its maximum value of 15. Notice the way the first record below writes \$0F (Byte 3) to the VOLUME register. The second one, just tells it loop back and do the same thing again. This will keep running until a new sound effect is selected.

<code>setVolToMax</code>	<code>.BYTE \$00,PLAY_SOUND,\$0F,VOLUME,\$01</code>
	<code>.BYTE \$00,LINK,<setVolToMax,>setVolToMax,\$00</code>

We can get a picture of how each record affects the relevant registers in the SID interface by looking at the table below. This is full history of each record that's processed in the `planetWarpSoundEffect` data structure by `PlaySoundEffects` in temporal order. Notice the way the volume steadily decreases as we go through the `PLAY_LOOP` loop towards the end.

Data Frame	Voice 2				Voice 3				Volume
	Sound	Gate	Saw	Decay	Sound	Gate	Saw	Decay	
\$00,PLAY_SOUND,\$0F,VOICE3_ATK_DEC,\$00	0	0	0	15	0	0	0	0	15
\$00,PLAY_SOUND,\$0F,VOLUME,\$00	0	0	0	15	0	0	0	0	15

\$18,PLAY_LOOP,\$00,<pwLoop,>pwLoop	768	0	1	15	776	0	1	1	15

6.4.2 Multiplexing

While playing the fairly dull component we cover above, Iridis Alpha plays a second sequence simultaneously that constitutes the one a player will know and recognize.

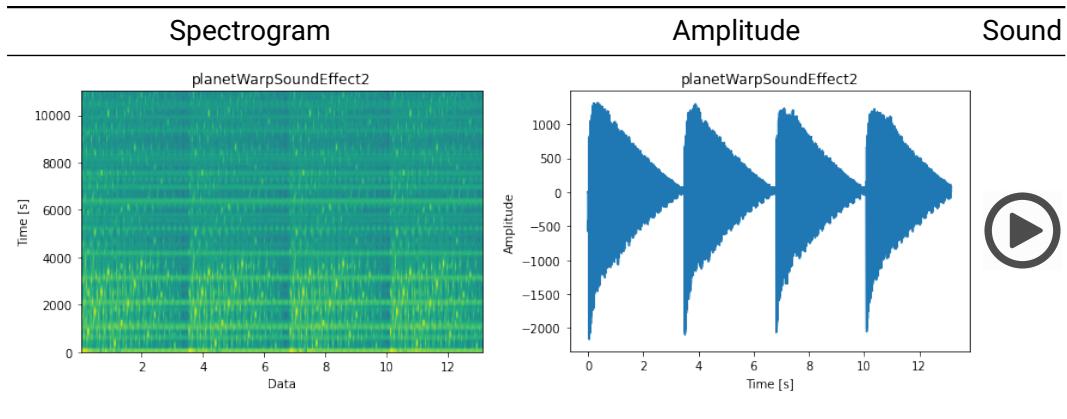

Figure 6.10

The way this concurrency is managed is by storing the addresses for each effect separately. In the case of the sequence where the player is entering a new planet this is done in `PerformPlanetWarp`, the routine responsible for rendering the warp sequence as a whole:

```
PerformPlanetWarp
    ...
    LDA #<planetWarpSoundEffect
    STA secondarySoundEffectLoPtr
    LDA #>planetWarpSoundEffect
    STA secondarySoundEffectHiPtr
    LDA #<planetWarpSoundEffect2
    STA primarySoundEffectLoPtr
    LDA #>planetWarpSoundEffect2
    STA primarySoundEffectHiPtr
```

With the primary and secondary sound effects stored in `primarySoundEffectLo/HIPtr` and `secondarySoundEffectLo/HIPtr` respectively, all the `PlaySoundEffects` routine has to do it ensures that it processes each of the effects every time it is visited by the raster interrupt. Here we see it take in the 'primary' sound effect and process it in `PlayCurrentSoundEffect`:

```
PlaySoundEffects
    LDA #$00
    STA indexToPrimaryOrSecondarySoundEffectPtr
    LDA soundEffectInProgress
    BEQ DontDecrementSoundEffectProgressCounter
    DEC soundEffectInProgress
DontDecrementSoundEffectProgressCounter
    LDA primarySoundEffectLoPtr
```

```

STA currentSoundEffectLoPtr
LDA primarySoundEffectHiPtr
STA currentSoundEffectHiPtr
JSR PlayCurrentSoundEffect

```

And here we see it then move on to processing the secondarySoundEffect. Notice that it falls through to PlayCurrentSoundEffect rather than having to call it directly with JSR:

```

LDA #$02
STA indexToPrimaryOrSecondarySoundEffectPtr
LDA secondarySoundEffectLoPtr
STA currentSoundEffectLoPtr
LDA secondarySoundEffectHiPtr
STA currentSoundEffectHiPtr
;Falls through and plays secondary sound effect.

;-----
; PlayCurrentSoundEffect
;-----
PlayCurrentSoundEffect
LDY #$00
; Read the 5-byte record into working storage.
FillSoundEffectDataStructureLoop
LDA (currentSoundEffectLoPtr),Y
STA soundEffectDataStructure,Y
INY
CPY #$05
BNE FillSoundEffectDataStructureLoop

```

The secondary sound effect for the planet warp sequence, which is the one with all the recognizable noises, looks like this:

```

.pwLoop
    .BYTE $00,PLAY_SOUND,$0F,VOICE1_ATK_DEC,$00
    .BYTE $00,PLAY_SOUND,$00,VOICE1_SUS_REL,$00
    .BYTE $00,PLAY_SOUND,$00,VOICE1_HI,$00
    .BYTE $00,PLAY_SOUND,$11,VOICE1_CTRL,$02
    .BYTE $01,INC_AND_PLAY_FROM_BUFFER,$64,VOICE1_HI,$01
    .BYTE $00,REPEAT_PREVIOUS,$08,$00,$00
    .BYTE $01,INC_AND_PLAY_FROM_BUFFER,$18,VOICE1_HI,$01
    .BYTE VOLUME,PLAY_LOOP,$01,<pwLoop,>pwLoop
    .BYTE $00,PLAY_SOUND,$10,VOICE1_CTRL,$00
    .BYTE $00,LINK,<setVolumeToMax,>setVolumeToMax,$00

```

Just like the primary sound effect we discussed this one contains a loop, achieving the same effect as before. There are a couple of new record types in there though, namely INC_AND_PLAY_FROM_BUFFER and REPEAT_PREVIOUS. The latter is probably self-explanatory, it repeats processing of the previous record for as many times as given by the value in Byte 3 which in this case is \$08 times.

INC_AND_PLAY_FROM_BUFFER does something more interesting, in the first case above it's being used to update the sound we play (i.e. write to register VOICE1_HI) by a regularly incrementing amounts of \$64 given in Byte 3. This value is picked from and updated in position 1 of the soundEffectBuffer, this position being given by Byte 1. The result is the 'iconic' bleeping sound that increases in frequency as we warp into the planet. Here we see the section in PlaySoundEffects that processes records of type INC_AND_PLAY_FROM_BUFFER, and the way it uses each byte in the record to effect the update and the write to the sound register:

```
; Increment the value in the buffer and play it.
LDX soundEffectDataStructure_Byte1
LDA soundEffectBuffer,X
CLC
ADC soundEffectDataStructure_Byte3
LDX soundEffectDataStructure_Byte4
STA soundEffectBuffer,X
STA $D400,X ;Voice 1: Frequency Control - Low-Byte
JMP GetNextRecordAndMaybePlayIt
```

The amount of looping the data structure demands is much greater than the effect we reviewed previously. We can get a sense of this from the truncated trace which shows a total of over 250 writes to the sound register and of which the table below is just a snapshot:

Record Type	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5
Play Sound	Unused	PLAY_SOUND (\$00)	Value to write to offset to \$D400 given by Byte 4.	Offset to \$D400 '01' indicates should play no more records. Anything else indicates the next record to write to.	'00' indicates the next record should be played immediately.
Increment and Play from Buffer	Address of byte to pick from soundEffectBuffer (\$01)	INC_AND_PLAY_FROM_BUFFER	Amount to increment picked byte by.	Offset to \$D400 '01' indicates should play no more records. Anything else indicates the next record to write to.	'00' indicates the next record should be played immediately.
Decrement and Play from Buffer	Address of byte to pick from soundEffectBuffer (\$02)	DEC_AND_PLAY_FROM_BUFFER	Amount to decrement picked byte by.	Offset to \$D400 '01' indicates should play no more records. Anything else indicates the next record to write to.	'00' indicates the next record should be played immediately.
Play Loop	Address of byte to pick from soundEffectBuffer (\$05) and offset to \$D400	PLAY_LOOP	Amount to decrement picked byte by.	Lo Ptr of next record.	Hi Ptr of next record.
Link to Record	Unused.	LINK (\$80)	Lo Ptr of next record.	Hi Ptr of next record.	'00' indicates the next record should be played immediately.
Repeat Previous Record	Unused.	REPEAT_PREVIOUS (\$81)	Number of times to play previous record	Unused.	'01' indicates should play no more records. Anything else indicates the next record should be stored and no more should be played for now.

A sample of the processing of records in the planetWarpSoundEffect2 data structure.

6.4.3 Unused Sound Effects

The PlaySoundEffects code has some leftover routines for record types that appear to have gone unused in the final game. These make slightly more complicated use of the soundEffectBuffer. All they do is mutate the data in the buffer using the 5-byte record. They don't actually play any sounds or make any writes to the SID register.

For example here is the logic applied to records with a 'type byte' in Byte 2 of (\$03):

```
TrySequenceByteValueOf3
    CMP #\$03
    BNE TrySequenceByteValueOf4
    LDX soundEffectDataStructure_Byt1
    LDY soundEffectDataStructure_Byt3
```

```
LDA soundEffectBuffer,X  
CLC  
ADC soundEffectBuffer,Y  
JMP GetNextRecordInSoundEffectLoop
```

This takes the value in Byte 1 as an offset into `soundEffectBuffer`, adds the value found at the offset in `soundEffectBuffer` given by Byte 3 and stores the result in the A accumulator. It then proceeds directly to reading the next record in the sound effect's data structure.

Logic for records with a type of \$04 does the same thing but subtracts rather than adds:

```
TrySequenceByteValueOf4  
  CMP #$04  
  BNE MaybeIsFadeOutLoop  
  LDX soundEffectDataStructure_Byte1  
  LDY soundEffectDataStructure_BYTE3  
  LDA soundEffectBuffer,X  
  SEC  
  SBC soundEffectBuffer,Y  
  JMP GetNextRecordInSoundEffectLoop
```

So the general idea for these two unused record types seems to have been that the `soundEffectBuffer` could be used to generate a sequence of sounds in some sort of procedural or even fractal manner, similar to the way in which the title music was generated. The experiment obviously didn't work as they ended up on the cutting room floor, with just this leftover code to indicate the attempt.

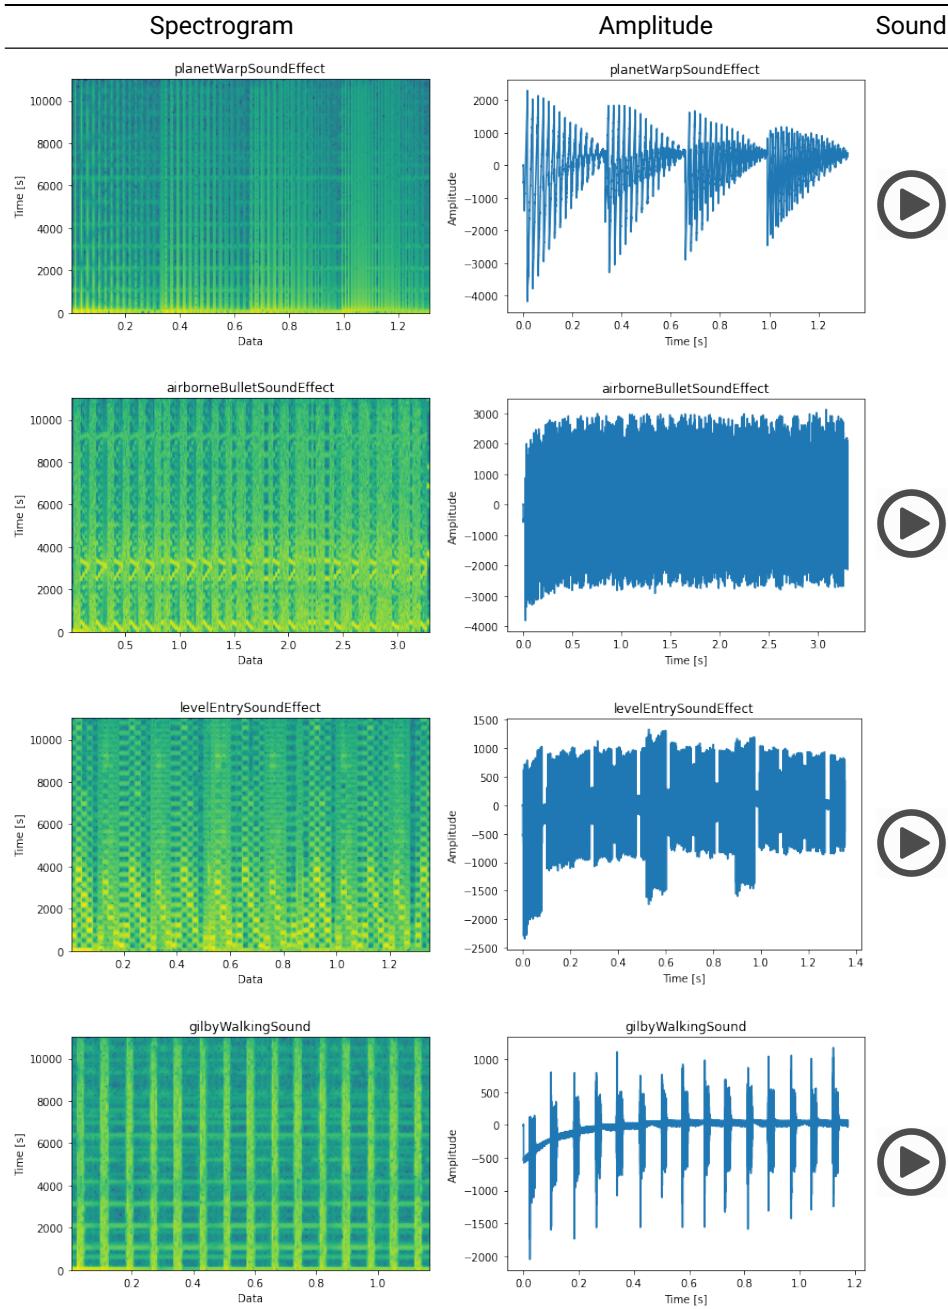

Figure 6.12: Some of the sound effects played during the game. On PDF viewers that support it, you can click the play icon to hear the effect.

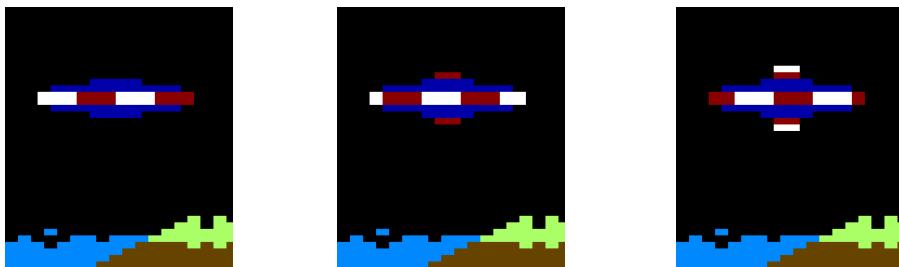

Enemies and their Discontents

Jeffrey Says

This is the bit that I knew would take me ages to write and get glitch free, and the bit that is absolutely necessary to the functioning of the game. The module ACONT is essentially an interpreter for my own 'wave language', allowing me to describe, exactly, an attack wave in about 50 bytes of data. The waves for the first part of IRIDIS are in good rollicking shoot-'em-up style, and there have to be plenty of them. There are five planets and each planet is to have twenty levels associated with it. It's impractical to write separate bits of code for each wave; even with 64K you can run outta memory pretty fast that way, and it's not really necessary coz a lot of stuff would be duplicated. Hence ACONT.

The bits and bytes that define the behaviour and appearance of wave after wave of Iridis Alpha's enemy formations - twenty across each of the five planets giving one hundred in all - take up relatively little space given the sheer variety of adversaries the player faces.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite colour
Byte 1-2	FLYING_SAUCER1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	FLYING_SAUCER1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$40	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level1Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$06	X Pos movement for attack ship.
Byte 19	\$01	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Figure 7.1: Sheep Planet - Level 1 - Enemy Data for the First Wave.

7.1 Something Simple - Byte 0: The Enemy's Color

To get an understanding of how the level data is used we can start with the very first byte of the data used for the first wave in the very first level. This is the wave of flying saucers you will already be familiar with if you have played the game:

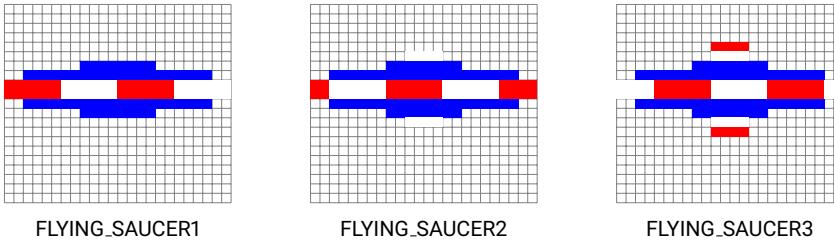

Figure 7.2: The sprites used to animate the 'UFO' in the first level.

The main colour for this sprite is blue. This may not be obvious from looking at the sprites themselves, but the way the sprite colour schemes work is that you can select two colours that are available for all sprites and one colour that is unique to the sprite itself. In this case, the unique colour selected for the flying saucers is determined by Byte 1 in the Level Data. You can see in the table in the page opposite that this is defined with a value of \$06. This is how it looks in the code itself:

```
planet1Level1Data
; Byte 0 (Index $00): An index into colorsForAttackShips
; that applies a colour value for the ship sprite.
.BYTE $06
```

This value is an index into the array `colorsForAttackShips`. Starting at zero we count up to 6 and arrive at the 7th item in the list below, giving us the result **BLUE**:

```
colorsForAttackShips
.BYTE BLACK,WHITE,RED,CYAN,PURPLE,GREEN,BLUE,YELLOW
.BYTE ORANGE,BROWN,LTRED,GRAY1,GRAY2,LTGREEN,LTBLUE,GRAY3
```

In the routine that draws the attack wave we find the following code segment writing this value to the register \$D027 that determines the colour of the sprite:

```
DrawUpperPlanetAttackShips
LDX #$0C
LDY #$06
UpperPlanetShipsLoop
```

```

...
LDX upperPlanetAttackShipsColorArray,Y
LDA colorsForAttackShips,X
STA $D027,Y ;Sprite Y Color
...
DEX
DEX
DEY
BNE UpperPlanetShipsLoop
RTS

```

Notice that the \$06 was originally stored in a position in the array `upperPlanetAttackShipsColorArray`. This happened in an earlier routine that loads the majority of the data for a level:

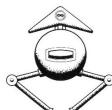

```

GetWaveDataForNewShip
; X is the index of the ship in activeShipsWaveDataLoPtrArray
LDY #$00
LDA (currentShipWaveDataLoPtr),Y
STA upperPlanetAttackShipsColorArray + $01,X

```

7.2 Bytes 1-4: Sprite Animation

Jeffrey Says

You pass the interpreter data, that describes exactly stuff like: what each alien looks like, how many frames of animation it uses, speed of that animation, colour, velocities in X- and Y- directions, accelerations in X and Y, whether the alien should 'home in' on a target, and if so, what to home in on; whether an alien is subject to gravity, and if so, how strong is the gravity; what the alien should do if it hits top of screen, the ground, one of your bullets, or you; whether the alien can fire bullets, and if so, how frequently, and what types; how many points you get if you shoot it, and how much damage it does if it hits you; and a whole bunch more stuff like that. As you can imagine it was a fairly heavy routine to write and get debugged, but that's done now; took me about three weeks in all I'd say.

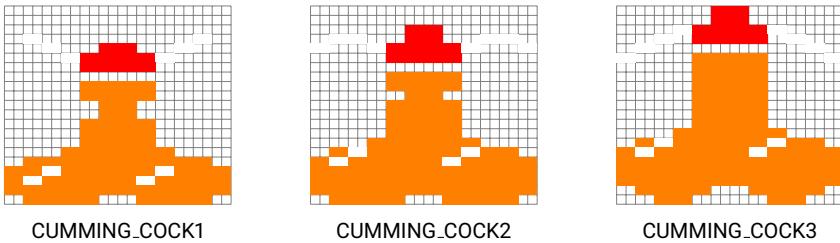

Figure 7.3: Confirmation that the game developer was a young caucasian male. The sprites used to animate attack wave 17 in the Mushroom Planet.

Looking again at the table in the previous page we can see the first 7 bytes are concerned with the appearance and basic behaviour of the enemy. Bytes 1 and 2 define the sprite used for display on the upper planet, Bytes 4 and 5 for the lower planet. The reason there's two in each case is because they are describing the start and end point of the sprite's animation.

We can see this in action in `AnimateAttackShipSprites`. When this routine runs Byte 3 has been loaded to `upperPlanetAttackShipInitialFrameRate` for the upper planet and `lowerPlanetAttackShipInitialFrameRate` for the lower planet. This routine is cycling through the sprites given by Byte 1 as the lower limit and Byte 2 as the upper limit. This is what the animation consists of: changing the sprite from one to another to create a classic animation effect.

```

AnimateAttackShipSprites
    LDA pauseModeSelected
    BEQ AnimateUpperPlanetAttackShips
    RTS

AnimateUpperPlanetAttackShips
    DEC upperPlanetAttackShipAnimationFrameRate - $01,X
    BNE AnimateLowerPlanetAttackShips

    LDA upperPlanetAttackShipInitialFrameRate - $01,X
    STA upperPlanetAttackShipAnimationFrameRate - $01,X
    INC upperPlanetAttackShip2SpriteValue,X
    LDA upperPlanetAttackShip2SpriteValue,X

    ; Reached the end of the animation?
    CMP upperPlanetAttackShipSpriteAnimationEnd - $01,X
    BNE AnimateLowerPlanetAttackShips

    ; Reset the animation sprite back to the start.
    LDA upperPlanetAttackShipSpritesLoadedFromBackingData - $01,X
    STA upperPlanetAttackShip2SpriteValue,X

```

```

AnimateLowerPlanetAttackShips
DEC lowerPlanetAttackShipAnimationFrameRate - $01,X
BNE DontAnimateLowerPlanetAttackShip

LDA lowerPlanetAttackShipInitialFrameRate - $01,X
STA lowerPlanetAttackShipAnimationFrameRate - $01,X
INC lowerPlanetAttackShip2SpriteValue,X
LDA lowerPlanetAttackShip2SpriteValue,X

; Reached the end of the animation?
CMP lowerPlanetAttackShipSpriteAnimationEnd - $01,X
BNE DontAnimateLowerPlanetAttackShip

; Reset the animation sprite back to the start.
LDA lowerPlanetAttackShipSpritesLoadedFromBackingData - $01,X
STA lowerPlanetAttackShip2SpriteValue,X
DontAnimateLowerPlanetAttackShip
RTS

```

Listing 7.1: Routine for Animating Enemy Sprites.

Byte 1 (loaded to `upperPlanetAttackShipAnimationFrameRate` comes into play here. It's decremented and as long as it's not zero yet the animation is skipped, execution jumps forward to `AnimateLowerPlanetAttackShips`:

```

AnimateLowerPlanetAttackShips
DEC lowerPlanetAttackShipAnimationFrameRate - $01,X
BNE DontAnimateLowerPlanetAttackShip

LDA lowerPlanetAttackShipInitialFrameRate - $01,X
STA lowerPlanetAttackShipAnimationFrameRate - $01,X
INC lowerPlanetAttackShip2SpriteValue,X
LDA lowerPlanetAttackShip2SpriteValue,X

; Reached the end of the animation?
CMP lowerPlanetAttackShipSpriteAnimationEnd - $01,X
BNE DontAnimateLowerPlanetAttackShip

; Reset the animation sprite back to the start.
LDA lowerPlanetAttackShipSpritesLoadedFromBackingData - $01,X
STA lowerPlanetAttackShip2SpriteValue,X

```

If it is zero, it instead gets reset to the initial value from Byte 1 (stored in `upperPlanetAttackShipInitialFrameRate`) and the current sprite for the enemy ship is incremented to point to the next 'frame' of the ship's animation:

```

AnimateUpperPlanetAttackShips
DEC upperPlanetAttackShipAnimationFrameRate - $01,X
BNE AnimateLowerPlanetAttackShips

LDA upperPlanetAttackShipInitialFrameRate - $01,X

```

```

STA upperPlanetAttackShipAnimationFrameRate - $01,X
INC upperPlanetAttackShip2SpriteValue,X
LDA upperPlanetAttackShip2SpriteValue,X

; Reached the end of the animation?
CMP upperPlanetAttackShipSpriteAnimationEnd - $01,X
BNE AnimateLowerPlanetAttackShips

; Reset the animation sprite back to the start.
LDA upperPlanetAttackShipSpritesLoadedFromBackingData - $01,X
STA upperPlanetAttackShip2SpriteValue,X

```

Next we check if we've reached the end of the animation by checking the value of Byte 2 (loaded to `upperPlanetAttackShipSpriteAnimationEnd`). If so, we reset `upperPlanetAttackShip2SpriteValue` to the value initially loaded from Byte 1 - and that is what will be used to display the ship the next time we pass through to animate the ship:

```

DrawUpperPlanetAttackShips
    LDX #$0C
    LDY #$06
UpperPlanetShipsLoop
    LDA upperPlanetAttackShipsXPosArray,Y
    STA $D000,X ;Sprite 0 X Pos

    LDA attackShipsXPosArray - $01,Y
    AND $D010 ;Sprites 0-7 MSB of X coordinate
    STA currentMSBXPosOffset

    LDA upperPlanetAttackShipsMSBXPosArray,Y
    AND attackShipsMSBXPosOffsetArray,Y
    ORA currentMSBXPosOffset
    STA $D010 ;Sprites 0-7 MSB of X coordinate

    LDA upperPlanetAttackShipsYPosArray,Y
    STA $D001,X ;Sprite 0 Y Pos
    STX tempVarStorage

    LDX upperPlanetAttackShipsColorArray,Y
    LDA colorsForAttackShips,X
    STA $D027,Y ;Sprite 0 Color

    LDA upperPlanetAttackShipsSpriteValueArray,Y
    STA Sprite0Ptr,Y
    LDX tempVarStorage

    DEX
    DEX
    DEY
    BNE UpperPlanetShipsLoop
    RTS

```

7.3 Bytes 18-21: Enemy Movement

Enemy movement is controlled by two parameters in each direction: the number of pixels to move in one go and the number of cycles to wait between each movement. So for movement in the horizontal (or X direction) Byte 18 controls the number of pixels to move at once, while Byte 20 controls the number of cycles to wait between each movement. The same applies to Byte 19 and Byte 21 for the vertical (or Y direction).

If we look at Byte 18 and Byte 20 for Level 1 we can see that the the fast lateral movement of the 'UFO's is implemented by a relatively high value of \$06 for the number of pixels it moves at each step while the interval between steps is relatively low (\$01). Meanwhile the more gradual up and down movement is implemented by a value of \$01 in Byte 19 and Byte 21.

For the second level ('bouncing rings') the horizontal movement is more constrained (Byte 18 is \$00) while the vertical movement is more extreme (Byte 19 is \$24) - achieving the bouncing effect.

Level	Byte 6	Byte 18	Byte 19	Byte 20	Byte 21
1	\$00	\$06	\$01	\$01	\$01
2	\$00	\$00	\$24	\$02	\$01
3	\$00	\$FA	\$01	\$01	\$02

Byte 6 : Whether a specific attack behaviour is used.

Byte 18: X Pos movement for attack ship.

Byte 19: Y Pos movement pattern for attack ship.

Byte 20: X Pos Frame Rate for Attack ship.

Byte 21: Y Pos Frame Rate for Attack ship.

Figure 7.4: Movement data for the first three levels.

The horizontal movement for Level Three, home to the infamous 'Licker Ships' is \$FA, which would make you think the enemies must be moving horizontally extremely quickly. In fact, when the high bit is set a special behaviour is invoked:

```
LDA xPosMovementForUpperPlanetAttackShip - $01,X
BMI UpperBitSetOnXPosMovement
```

Listing 7.2: From UpdateAttackShipsXAndYPositions.

This is the special behaviour that makes the Licker Ships on this level such an enormous pain in the arse to play against.

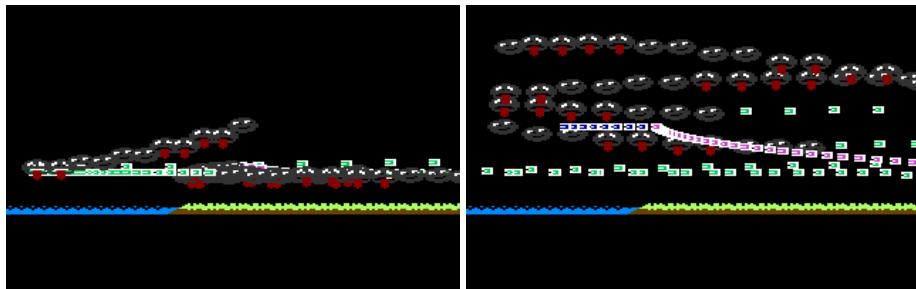

Figure 7.5: Enemy movement for Sheep planet, level 3 - the infamous licker ships.

When the upper bit is set (e.g. \$FC,\$80) on the value loaded to the accumulator by LDA then BMI will return true and jump to `UpperBitSetOnXPosMovement`.

```
UpperBitSetOnXPosMovement
    ; This creates a decelerating effect on the attack ship's
    ; movement.
    ; Used by the licker ship wave in planet 1 for example.
    EOR #$FF
    STA attackShipOffsetRate
    INC attackShipOffsetRate
    LDA upperPlanetAttackShip2XPos,X
    SEC
    SBC attackShipOffsetRate
    STA upperPlanetAttackShip2XPos,X
    BCS DecrementXPosFrameRateLowerPlanet

    LDA upperPlanetAttackShip2MSBXPosValue,X
    EOR attackShip2MSBXPosOffsetArray,X
    STA upperPlanetAttackShip2MSBXPosValue,X
```

This first line `EOR #$FF` performs an exclusive-or between Byte 19 in the Accumulator (\$FA) and the value \$FF. An exclusive-or, remember, is a bit by bit comparison of two bytes which will set a bit in the result if an only if the bit in one of the values is set but the other is not:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$FF	1	1	1	1	1	1	1	1
\$FA	1	1	1	1	1	0	1	0
Result	0	0	0	0	0	1	0	1

X-OR'ing \$FF and \$FA gives \$05.

This result is stored in `attackShipOffsetRate`:

```

UpperBitSetOnXPosMovement
; This creates a decelerating effect on the attack ship's movement.
; Used by the licker ship wave in planet 1 for example.
EOR #$FF
STA attackShipOffsetRate

```

Incremented:

```
INC attackShipOffsetRate
```

And then subtracted from the enemy's X position:

```

SEC
SBC attackShipOffsetRate
STA upperPlanetAttackShip2XPos,X

```

The net result is a deceleration effect. This is observed in the way the licker ship wave will accelerate out to the center before dialling back again.

7.3.1 What is going on with Byte 6?

Byte 6 comes into play when setting the initial Y position of a new enemy. This initial vertical position is random, but subject to some adjustment:

```

SetInitialRandomPositionUpperPlanet
JSR PutProceduralByteInAccumulatorRegister
AND #$3F
CLC
ADC #$40
STA upperPlanetAttackShipsYPosArray + $01,Y

STY previousAttackShipIndexTmp
; Byte 6 ($06): Usually an update rate for the attack ships.
LDY #$06
LDA (currentShipWaveDataLoPtr),Y
BNE ReturnFromLoadingWaveDataEarly

; Byte 8 ($08): Default initiation Y position for the enemy.
LDY #$08
LDA (currentShipWaveDataLoPtr),Y
BEQ ReturnFromLoadingWaveDataEarly

LDA #$6C
LDY previousAttackShipIndexTmp
STA upperPlanetAttackShipsYPosArray + $01,Y

ReturnFromLoadingWaveDataEarly

```

RTS

Listing 7.3: The sub-routine SetInitialRandomPositionUpperPlanet in GetWaveDateForNewShip.

The first order of business is to call PutProceduralByteInAccumulatorRegister which gets a random value and stores it in the accumulator.

```
PutProceduralByteInAccumulatorRegister
randomIntToIncrement =**+$01
  LDA randomPlanetData
  INC randomIntToIncrement
RTS
```

Since A can now contain anything from 0 to 255 (\$00 to \$FF) this needs to be adjusted to a meaningful Y-position value for the upper planet. So if we imagine PutProceduralByteInAccumulatorRegister returned \$85, we now do the following operations on it:

```
AND #$3F
CLC
ADC #$40
STA upperPlanetAttackShipsYPosArray + $01, Y
```

First we do an AND #\$3F with the value of \$85 in A:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
\$85	1	0	0	0	0	1	0	1
\$3F	0	0	1	1	1	1	1	1
Result	0	0	0	0	0	1	0	1

AND'ing \$3F and \$85 gives \$05.

Our result is \$05. The effect of the AND'ing here is to ensure that the random number we get back is between 0 and 63 rather than 0 and 255. Next we add \$40 (decimal 64) to this result:

```
CLC
ADC #$40
```

This gives \$45 and this is what we store as the initial Y position for the enemy.

You'll notice that the steps for SetInitialRandomPositionLowerPlanet are identical but with only the constant of the add value of \$98 instead of \$40. This is simply an additional offset to ensure that the Y position is lower on the screen for the initial position of the enemy on the lower planet.

We still haven't got into what Byte 7 is doing though. With an initial Y position determined, it looks like the intention was for Byte 6 to specify some adjustment to this value. But this looks like another bit of non-functioning game logic. If Byte 6 contains a value, the function will return early without any further adjustments. If it's zero it will then try Byte 8. If that's zero, it will return early. So the logic needs Byte 6 to be zero and Byte 8 to contain something for anything to happen. That's never the case, so the the adjustment never happens:

```
STY previousAttackShipIndexTmp
; Byte 6 ($06): Usually an update rate for the attack ships.
LDY #$06
LDA (currentShipWaveDataLoPtr),Y
BNE ReturnFromLoadingWaveDataEarly

; Byte 8 ($08): Default initiation Y position for the enemy.
LDY #$08
LDA (currentShipWaveDataLoPtr),Y
BEQ ReturnFromLoadingWaveDataEarly
```

Listing 7.4: An adjustment that never happens. Byte 6 and Byte 8 are never set in this way.

This is definitely some forgotten code. Byte 6 is elsewhere used in combination with Byte 7 and Byte 8 to define an alternate enemy mode for some levels where the ship will supplement any dead ships with alternate enemy types and attack patterns periodically.

7.4 Bytes 6-8: Alternate Enemy Waves

This happens in `MaybeSwitchToAlternateEnemyPattern` in `UpdateAttackShipDataForNewShip`.

```
MaybeSwitchToAlternateEnemyPattern
; Byte 6 ($06): Usually an update rate for the attack ships.
LDY #$06
LDA (currentShipWaveDataLoPtr),Y
BEQ EarlyReturnFromAttackShipBehaviour

DEC rateForSwitchingToAlternateEnemy,X
BNE EarlyReturnFromAttackShipBehaviour

LDA (currentShipWaveDataLoPtr),Y
STA rateForSwitchingToAlternateEnemy,X

; Push the current ship's position data onto the stack.
TXA
PHA
```

```

LDY indexIntoUpperPlanetAttackShipXPosAndYPosArray ,X
LDA upperPlanetAttackShipsXPosArray + $01,Y
PHA
LDA upperPlanetAttackShipsMSBXPosArray + $01,Y
PHA
LDA upperPlanetAttackShipsYPosArray + $01,Y
PHA

; Are we on the top or bottom planet?
TXA
AND #$08
BNE LowerPlanetAttackShipBehaviour

```

Listing 7.5: Byte 6 is used to periodically switch to an enemy mode defined by Bytes 7-8

Byte 6 is used to drive the rate at which this routine switches over to the enemy data-/mode defined by Byte 7 and Byte 8.

```

DEC rateForSwitchingToAlternateEnemy,X
BNE EarlyReturnFromAttackShipBehaviour

LDA (currentShipWaveDataLoPtr),Y
STA rateForSwitchingToAlternateEnemy,X

```

Listing 7.6: `rateForSwitchingToAlternateEnemy` (Byte 6) is decremented and reloaded each time it reaches zero.

What this routine is going to do is replace the first dead ship it finds in the current wave with the wave data pointed to by Byte 7-8 and create a new enemy with the current ship's position with it.

First, we store the current ship's position. The way to do this is get the index (Y) for the current ship X and store each of the X and Y Position information into the accumulator A and then push it onto the 'stack' (PHA which means 'push A onto the stack').

```

; Push the current ship's position data onto the stack.
TXA
PHA
LDY indexIntoUpperPlanetAttackShipXPosAndYPosArray ,X
LDA upperPlanetAttackShipsXPosArray + $01,Y
PHA
LDA upperPlanetAttackShipsMSBXPosArray + $01,Y
PHA
LDA upperPlanetAttackShipsYPosArray + $01,Y
PHA

```

When this has run the stack of accumulator values now looks like this:

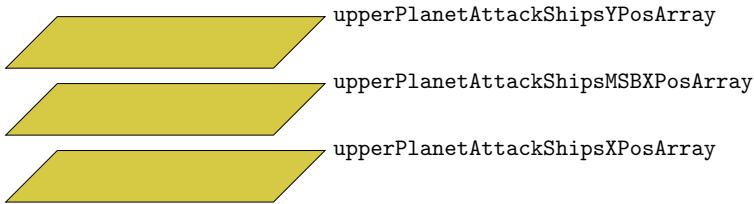

Figure 7.6: The stack after the code above has run with `upperPlanetAttackShipsXPosArray` at the top.

With our position data safely stashed away on the stack we now decide which planet we're on:

```
; Are we on the top or bottom planet?
TXA
AND #$08
BNE LowerPlanetAttackShipBehaviour
```

If we're on the upper planet we use `SetXToIndexOfShipThatNeedsReplacing` to look in the `activeShipsWaveDataHiPtrArray` for any ships that need replacing between positions \$02 and \$06. If we don't find one, we return early:

```
; We're on the upper planet.
LDX #$02
ProcessAttackShipBehaviour
JSR SetXToIndexOfShipThatNeedsReplacing
BEQ ResetAndReturnFromAttackShipBehaviour
```

If we do find one we can now pull (or 'pop') the positional data we stored away in the stack and assign that to the once-dead ship. First we use the index we retrieved to X to get the ship's index (Y) into the positional arrays:

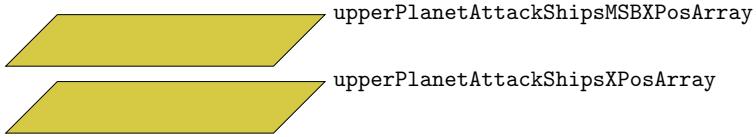

```
LDY indexIntoUpperPlanetAttackShipXPosAndYPosArray ,X
```

Then we pop the first positional item `upperPlanetAttackShipsYPosArray` from the top of the stack and store in the new ship's position in the array:

```
PLA
STA upperPlanetAttackShipsYPosArray + $01 ,Y
```

Listing 7.7: "PLA remove the top item from the stack and stores it in A

The stack now looks like this, popping from the stack has the effect of removing the first item:

Then we pop the rest of the items one by one and assign them to the new ship. We ignore the sprite's MXB offset if it is zero:

```

PLA
BEQ MSBXPosOffsetIzZero

LDA attackShipsMSBXPosOffsetArray + $01,X
MSBXPosOffsetIzZero
STA upperPlanetAttackShipsMSBXPosArray + $01,Y
PLA
STA upperPlanetAttackShipsXPosArray + $01,Y
PLA

; Byte 8 of Wave Data gets loaded now. Bytes 8 and 9
; contain the hi/lo ptrs to the alternate enemy data.
LDY #$07
JMP UpdateWaveDataPointersForCurrentEnemy

```

Listing 7.8: PLA remove the top item from the stack and stores it in A.

Now that we have set up the positional data for the new enemy we load all its other features from the data pointed to by Byte 8-9:

```

; Byte 8 of Wave Data gets loaded now. Bytes 8 and 9
; contain the hi/lo ptrs to the alternate enemy data.
LDY #$07
JMP UpdateWaveDataPointersForCurrentEnemy

```

Let's take a closer look at this routine `UpdateWaveDataPointersForCurrentEnemy`. What it does in this instance is take the address pointed to by Bytes 8 and 9 and load the data there using the routine `GetWaveDataForNewShip`. To be used in this way the values in Bytes 8 and 9 are combined and treated as an address in memory. For example if Byte 8 contains \$70 and Byte 9 contains \$13 they are treated as providing the address \$1370. This is the location where the enemy data for `planet1Level8Data` is kept so that is what is loaded.

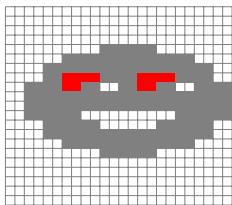

Planet	Level	Byte 6	Bytes 7-8
1	11	\$03	smallDotWaveData
1	14	\$03	planet1Level8Data
2	19	\$0C	landGilbyAsEnemy
3	4	\$04	gilbyLookingLeft
3	6	\$04	planet3Level6Additional
4	19	\$01	planet4Level19Additional
5	3	\$01	planet5Level3Additional
5	5	\$05	planet5Level5Additional
5	14	\$06	llamaWaveData

Byte 6 : Whether a specific attack behaviour is used.

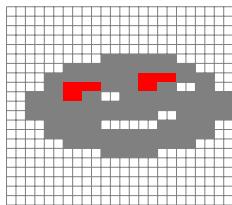

Bytes 7-8 : Lo and Hi Ptr for alternate enemy mode

Figure 7.7: Actual use of Bytes 6, 7, and 8. Note that the value in Byte 6 doesn't matter, as long as it's non-zero.

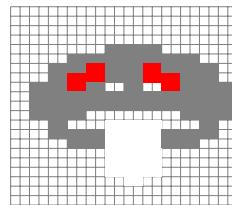

7.5 Bytes 22-23: The Bytes of Death

LICKER_SHIP1

LICKERSHIP2

LICKERSHIP3

Figure 7.8: These arseholes.

An irritating early hurdle in Iridis Alpha's gameplay is the behaviour of the licker ships in the game's third level. When shot the enemies turn into licker ships that seek out the player and then stick to them, sapping the player's energy until they lose a life. This behaviour is defined by Bytes 22 and 23.

```
lickerShipWaveData = $1118
..
; Byte 22 (Index $16): Stickiness factor, does the enemy stick to
; the player sapping their energy if they're near them?
.BYTE $01
; Byte 23 (Index $17): Does the enemy gravitate quickly toward the
; player when its been shot? (Typical licker ship behaviour)
.BYTE $01
```

```
..
```

Implementing each of these is relatively straightforward. Since the gilby is always in the centre of the screen (on the X axis at least), all an enemy has to do is figure out whether the gilby is above or below it and move in that direction. If we leave out the slightly complicated logic to figure out where the gilby is relative to us, we are left with this:

```
MaybeQuicklyGravitatesToGilby
; Byte 23: Does the enemy gravitate quickly towards the gilby
; when it is shot?
LDY #$17
LDA (currentShipWaveDataLoPtr),Y
BEQ MaybeStickyAttackShipBehaviour
...
; Figure out the relative position of the gilby and
; store it in positionRelativeToGilby
...
; Now decide whether to move up or down.
CMP positionRelativeToGilby
BEQ NoVerticalMovementRequired
BMI MoveDownToGilby
MoveUpToGilby
DEC yPosMovementForUpperPlanetAttackShips,X
DEC yPosMovementForUpperPlanetAttackShips,X
MoveDownToGilby
INC yPosMovementForUpperPlanetAttackShips,X
NoVerticalMovementRequired
LDA indexForActiveShipsWaveData,X
TAX
```

Sticking to the gilby involves the same logic but along the horizontal axis. After all if we're sticking to the gilby we want to stay in the centre of the screen.

```
MaybeStickyAttackShipBehaviour
; Byte 22: Does the enemy have the stickiness behaviour?
LDY #$16
LDA (currentShipWaveDataLoPtr),Y
BEQ MaybeSwitchToAlternateEnemyPattern
...
; Figure out the relative position of the gilby and
; store it in positionRelativeToGilby
...
CMP positionRelativeToGilby
BMI MoveRightToGilby
MoveLeftToGilby
DEC xPosMovementForUpperPlanetAttackShip,X
DEC xPosMovementForUpperPlanetAttackShip,X
MoveRightToGilby
INC xPosMovementForUpperPlanetAttackShip,X
NoHorizontalMovementRequired
```

```
LDA indexForActiveShipsWaveData,X  
TAX
```

7.6 Byte 35: Energy Multiplier

When an enemy is struck this byte contains the multiplier applied to the player's energy boost:

```
IncreaseEnergyTopOnly  
LDY #$23  
LDA (currentShipWaveDataLoPtr),Y  
BEQ NormalTopEnergyIncrease  
STA energyChangeCounter  
EnergyTopIncreaseLoop  
JSR IncreaseEnergyTop  
DEC energyChangeCounter  
BNE EnergyTopIncreaseLoop  
RTS  
  
NormalTopEnergyIncrease  
JMP IncreaseEnergyTop  
; Returns
```

The above is for the top planet energy counter, the logic for the bottom planet is identical:

```
IncreaseEnergyBottomOnly  
LDY #$23  
LDA (currentShipWaveDataLoPtr),Y  
BEQ NormalBottomEnergyIncrease  
STA energyChangeCounter  
EnergyBottomIncreaseLoop  
JSR IncreaseEnergyBottom  
DEC energyChangeCounter  
BNE EnergyBottomIncreaseLoop  
RTS  
  
NormalBottomEnergyIncrease  
JMP IncreaseEnergyBottom  
; Returns
```

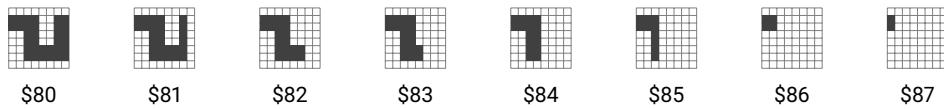

Figure 7.9: Tilesheet: Energy Bar Character Set

Actually writing the updated energy level to the screen uses the tileset above in the routine `IncreaseEnergyTop`:

```
IncreaseEnergyTop
    STX temporaryStorageForXRegister
    LDX currEnergyTop
    DEC SCREEN_RAM + LINE22_COL3,X

7.8 Bytes 9-11: A Clever Plan

Byte	Value	Description
Byte 9	nullPtr	Unused Lo Ptr to an arbitrary run of Bytes 18-21.
Byte 10	nullPtr	Unused Hi Ptr to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limiter for use of Bytes 9 and 10.
..
Byte 18	\$06	X Pos movement for attack ship.
Byte 19	\$01	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.

Figure 7.10: Bytes 9 to 11, and 18 to 21.

Bytes 9 to 11 were intended to carry out a clever plan that was probably too clever for its own good and as a result ended up being dropped. The idea was that Bytes 9 and 10 would point to Bytes 18 to 21 in another set of level data, enabling the enemy to have a second phase of movement behaviour in addition to its native movement.

The routine for processing these bytes appears in `UpdateAttackShipDataForNewShip`.

```
UpdateAttackShipDataForNewShip

; Byte 10:
LDY #10
LDA (currentShipWaveDataLoPtr),Y
BEQ MaybeQuicklyGravitatesToGilby

JMP MaybeQuicklyGravitatesToGilby
```

Since Bytes 9 to 11 are zero in all level data, the routine is never run. On balance the idea does seem unnecessarily complex: why not just load a completely new set of level data with modified behaviour and the same sprite? This uses up more space overall but it is certainly easier to manage. Indeed, much of the level data is given over to chaining level data in this way. Let's look at that now.

7.9 Bytes 15-17: Sprite Switching

Byte 15 defines a value that is periodically decremented and when it reaches zero the level data pointed to by Bytes 16 and 17 is loaded. This is used in the very first level to switch the main sprite colour of the flying UFOs.

Byte	Value	Description
Byte 15	\$40	Update rate for periodically switching to wave defined in Bytes 16-17.
Byte 16	planet1Level1Data2ndStage	Lo Ptr to the wave data we switch to periodically.
Byte 17	planet1Level1Data2ndStage	Hi Ptr to the wave data we switch to periodically.

Figure 7.11: planet1Level1Data: Bytes 15 to 17 for Level 1 on the Sheep Planet.

The way it works is Byte 15 is loaded to the appropriate position in updateRateForAttackShips:

```
GetWaveDataForNewShip
..
; Byte 15; Update Rate for Attack Waves
LDY #15
LDA (currentShipWaveDataLoPtr),Y
STA updateRateForAttackShips,X
```

This is then periodically decremented in GetNewShipDataFromDataStore. When it reaches zero we end up jumping to SwitchToAlternatingWaveData:

```
DEC updateRateForAttackShips,X
BNE UpdateAttackShipDataForNewShip
; Byte 14: Controls the rate at which new enemies are added.
; This is only set when the current ship data is defaultExplosion
; so in most cases we will go straight to SwitchToAlternatingWaveData
.
LDY #14
LDA (currentShipWaveDataLoPtr),Y
BEQ SwitchToAlternatingWaveData
```

This now pulls in Bytes 16 and 17 from the level data and uses them as the address of the level data to switch to:

```
SwitchToAlternatingWaveData
LDY #16
-----
; UpdateWaveDataPointersForCurrentEnemy
-----
UpdateWaveDataPointersForCurrentEnemy
```

```

; Byte 16  Y has been set to 16 above, so we're pulling in the
; pointer
; to the second tranche of wave data for this level.
; Or Y has been set by the caller.
LDA (currentShipWaveDataLoPtr),Y
PHA
INY
; Byte 17
LDA (currentShipWaveDataLoPtr),Y

; If we have a nullPtr then there's no wave data to get
; so the enemy ship can be cleared out and we can return.
BEQ ClearDeadShipFromLevelData

STA activeShipsWaveDataHiPtrArray,X
STA currentShipWaveDataHiPtr
PLA
STA currentShipWaveDataLoPtr
STA activeShipsWaveDataLoPtrArray,X

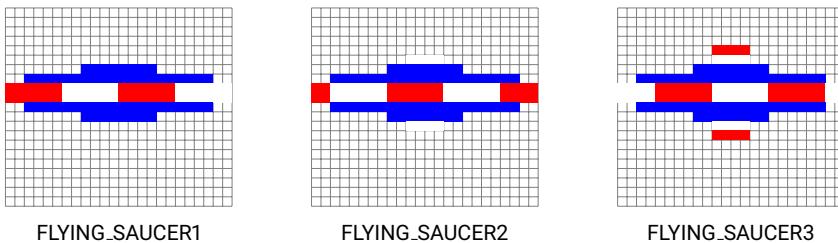

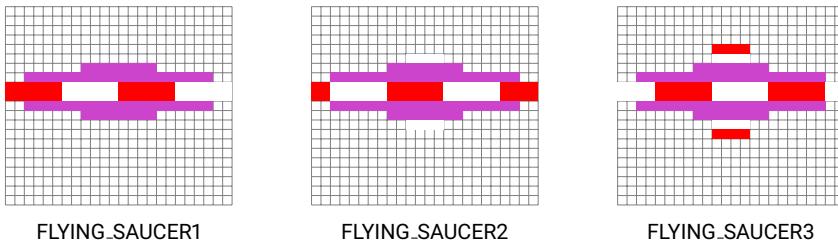

```

In the case of Level 1 this second set of wave data is at `planet1Level1Data2ndStage`. This data is more or less the same as `planet1Level1Data` with the exception of the bytes in the table below.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite colour
Byte 16	<code>planet1Level1Data</code>	Lo Ptr to the wave data we switch to periodically.
Byte 17	<code>planet1Level1Data</code>	Hi Ptr to the wave data we switch to periodically.

Figure 7.12: `planet1Level1Data`: Bytes 15 to 17 for Level 1 on the Sheep Planet.

The effect therefore is that the main sprite colour changes (although the sprite stays the same) and when the periodic decrementing of Byte 15 reaches zero again it will switch back to `planet1Level1Data`. This switching back and forth will continue for as long as the enemy does not collide with anything or is not hit.

Figure 7.13: Level 1 Sprite as given by `level1Planet1Data`.Figure 7.14: Level 1 Sprite as given by `level1Planet1Data2ndStage`.

7.10 Bytes 28-29: Data to Load When Hit by a Bullet

Byte	Value	Description
Byte 28	spinningRings	Lo Ptr for data to switch to when hit by bullet.
Byte 29	spinningRings	Hi Ptr for data to switch to when hit by bullet.

Figure 7.15: `planet1Level1Data`: Bytes 28 to 29 for Level 1 on the Sheep Planet.

Bytes 28 and 29 define the level data to load when struck by a bullet. In the case of our flying UFOs this is the spinning rings.

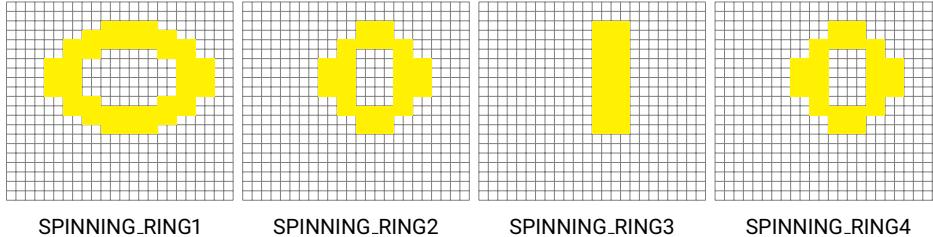

Figure 7.16: The sprites used to animate the spinning rings.

```

UpdateScoresAfterHittingShipWithBullet
  ..
  ; Byte 29: Load the explosion animation, if there is one. For most
  ; enemies this is the spinning rings defined by spinningRings.
LoadExplosionAnimation
  LDY #29
  LDA (currentShipWaveDataLoPtr),Y
  BEQ CheckForCollisionsBeforeUpdatingCurrentShipsWaveData
  ; There's a Hi Ptr for the explosion animation, so decrement
  ; Y to point it at the Lo Ptr and load the ptrs as the new
  ; wave data for the enemy.
  DEY
  JMP UpdateWaveDataPointersForCurrentEnemy
; Returns

```

This is also the path used to load the licker ships after the relatively inoffensive flying blue dots have been struck by a bullet.

Byte	Value	Description
Byte 0	\$05	Index into array for sprite colour
Byte 1	FLYING_DOT1	Sprite value for the attack ship on the upper planet
Byte 28	lickerShipWaveData	Lo Ptr for data to switch to when hit by bullet.
Byte 29	lickerShipWaveData	Hi Ptr for data to switch to when hit by bullet.

Figure 7.17: Sheep Planet - Level 3 .

7.11 Bytes 30-31: Data to Load After Colliding with the Player

Byte	Value	Description
Byte 30	defaultExplosion	Lo Ptr for data to switch to after colliding with gilby.
Byte 31	defaultExplosion	Hi Ptr for data to switch to after colliding with gilby.

Figure 7.18: planet1Level1Data: Bytes 30 to 31 for Level 1 on the Sheep Planet.

Bytes 30 and 31 define the level data to load when the enemy has collided with the player. In the case of our flying UFOs this is the default explosion animation.

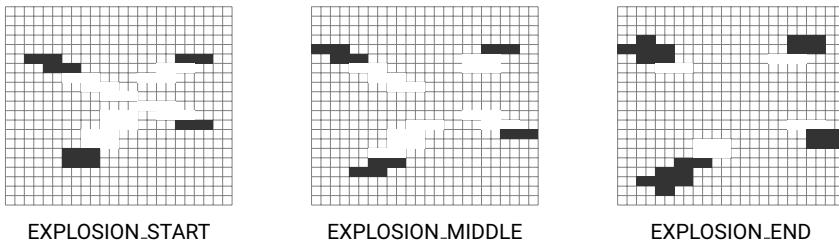

Figure 7.19: The sprites used to animate the collision explosion.

These bytes are only inspected when responding to a collision. The routine `UpdateEnergyLevelsAfterCollision` first establishes if the enemy saps energy from the gilby by inspecting Byte 35. Once the updated player energy is calculated the collision explosion data is loaded.

```
UpdateEnergyLevelsAfterCollision
; Byte 35: Check if the enemy saps energy from the gilby?

LoadExplosionData
; Byte 30: Hi/Lo Ptr for the collision explosion level data.
LDY #30
JMP UpdateWaveDataPointersForCurrentEnemy
; Returns

```

7.12 Bytes 24-27 and 32-33: Enemy Phases

Rather than exploding when first hit, some enemy waves are configured to metamorphose into something else, so they end up requiring multiple hits before they oblige the player by finally exploding.

The level data accommodates up to four incarnations in total for an enemy wave.

Byte	Value	Description
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 32-33	nullPtr	Pointer for fourth wave of attack ships.

Figure 7.20: Mostly unused: the contents of these bytes for most levels in the game.

```

    LDY #33
    LDA (currentShipWaveDataLoPtr),Y
    BEQ No4thWaveData
    DEY
    JMP UpdateWaveDataPointersForCurrentEnemy
; Returns

```

In the table on the following page we can see the relatively spare use made of this functionality. Most of the planets only use one of the waves in 6 or 7 levels. What's notable is that that only one level makes use of **both** Bytes 24-25 and Bytes 26-27 together: Level 12 on the Om Planet. This is also the only level that attempts to make use of Bytes 32-23.

CHAPTER 7. ENEMIES AND THEIR DISCONTENTS

Bytes 26-27: Pointer for third wave of attack ships.

Bytes 32-33: Pointer for fourth wave of attack ships.

Figure 7.21: Use of the Enemy Phases Bytes by Each Planet. Levels that make no use of them are excluded.

Congoatulations Hotshot

If you are a good boy, and transfer enough energy to the planets' cores, then you too can get to play Iridis Alpha's decidedly ropey mini-game.

```
EnterBonusPhaseInterruptHandler
UpdateCoreEnergyLevel
    LDX currCoreEnergyLevel
    ...
UpdateCoreGraphic
    DEC SCREEN_RAM + LINE23_COL13,X
    LDA SCREEN_RAM + LINE23_COL13,X
    CMP #$7F
    BNE ReturnFromCoreEnergyLevel
    LDA #$80
    STA SCREEN_RAM + LINE23_COL13,X
    INX
    ; Has currCoreEnergyLevel reached 14 yet?
    CPX #14
    ; If so, you get to play the bonus phase.
    BEQ MaybeEarnedBonusPhase

    ...
MaybeEarnedBonusPhase
    LDA lowerPlanetActivated
    BEQ EarnedBonusPhase
    DEX
    JMP FinalizeLevelAndReturn

EarnedBonusPhase
    INC bonusPhaseEarned
ReturnFromCoreEnergyLevel
    RTS
```

Listing 8.1: bonusPhaseEarned is set once currCoreEnergyLevel reaches 14.

8.1 Entry Sequence

Figure 8.1: The entry sequence.

```
MaybeGoToBonusPhase
    LDA bonusPhaseEarned
    BEQ ResumeMainGameAgain
    SEI
    JSR StoreStatusBarDetail
    JSR ClearScreen3
    JSR DisplayEnterBonusRoundScreen
```

Listing 8.2: Good boys pass this test.

The entry sequence is an animated cascade of colored bars that appears to roll down from the top of the screen. You might assume we achieve this effect by simply drawing a series of colored text-based lines in a tight loop. Not the case:

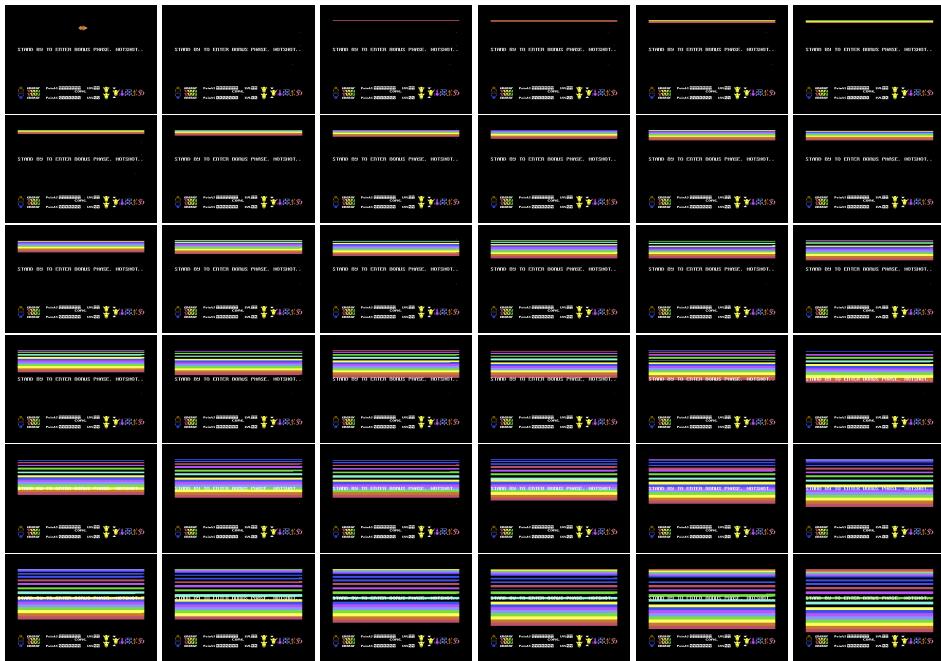

Figure 8.2: The entry effect filling the screen.

```
EnterBonusPhaseInterruptHandler
...
LDY  backgroundColorIndex
LDA  enterBPRainbowColors,Y
STA  $D021      ;Background Color 0
```

What we actually do is update the screen's background color as the raster travels down the screen. The above three lines do this about 30 times every single paint of the screen, updating the background color that gets painted as we go. The result is that each colored bar reflects the background color of the screen at the time the raster is passing it. The trick is to keep updating the background color at gradually increasing intervals.

After we update the background color we set the raster interrupt to the next position we're interested in:

```
EnterBonusPhaseInterruptHandler
...
LDY  backgroundColorIndex
LDA  enterBPRainbowColors,Y
STA  $D021      ;Background Color 0
```

```

; Check if we've reached the end of the rainbow effect.
LDA bpRasterPositionArray,Y
...
; Update the position of the next interrupt.
CLC
ADC $D012      ; Raster Position
STA $D012      ; Raster Position

```

The value we get from `bpRasterPositionArray` reflects our intention of painting increasingly tall bars:

<code>bpRasterPositionArray</code>	<code>.BYTE \$01,\$01,\$01,\$01,\$02,\$02,\$02,\$02</code>
	<code>.BYTE \$03,\$03,\$03,\$03,\$04,\$04,\$04,\$04</code>
	<code>.BYTE \$05,\$05,\$05,\$05,\$06,\$06,\$06,\$06</code>
	<code>.BYTE \$07,\$07,\$07,\$07,\$07,\$07,\$07,\$00</code>

Each value in here gets added to the current interrupt position (`ADC $D012`). The further we go down the screen the taller the bars become.

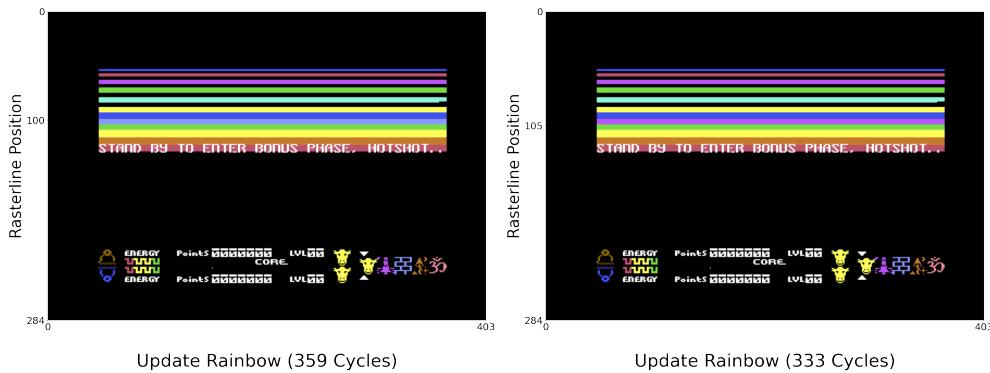

Figure 8.3: Updating the background color at a 5 line interval as given by `bpRasterPositionArray`.

In addition to drawing incrementally larger bars we're also shifting down by one row the color each one is painted at each pass. This is responsible for creating the visual effect of each bar moving independently down the screen.

Figure 8.4: The color sequences shifts down one position after each full screen paint.

This is managed by an array..

```
entryScreenRainbowColors
    .BYTE RED,ORANGE,YELLOW,GREEN,LTBLUE,PURPLE,BLUE,YELLOW
    .BYTE BLACK,CYAN,BLACK,GREEN,BLACK,PURPLE,BLACK,RED
    .BYTE BLACK,BLUE,BLACK,BLUE,BLACK,BLUE,PURPLE,LTBLUE
    .BYTE GREEN,YELLOW,ORANGE,RED
```

.. referenced in `UpdateEntryScreenRainbow`. After every full screen paint we update the array `previousRoundRainbowColors` to store the position of the previous bar that used it. This allows us to use `previousRoundRainbowColors` as a source for X the next time we finish a screen and shift the colors along by one position:

```
UpdateEntryScreenRainbow
    ...
    LDA entryScreenRainbowColors,X
    STA enterBPRainbowColors,Y
    TYA
    STA previousRoundRainbowColors,X
```

All in all, this is a neat effect and would only have been possible at the speeds achieved by using the raster interrupt in this way. Simply painting the screen with colored text would have been much slower.

8.2 Generating Maps

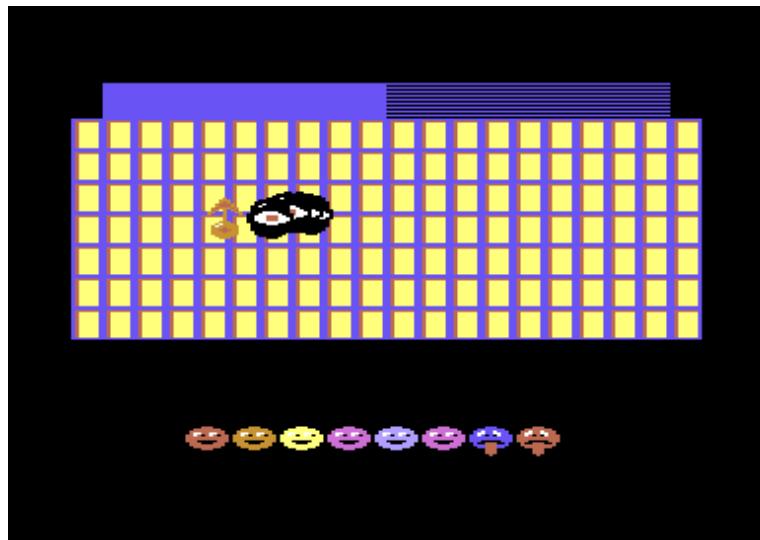

Figure 8.5: The beginning of the first bonus phase.

Every time the player enters the bonus phase we'll procedurally generate a new level for them to play. The way we'll manage this is by treating the level as a stack of 256 rows and defining it as an array of the rows that make up a complete map of the level.

This means that in order to generate a new map all we have to do is come up with an array of bytes where each byte defines a row. By way of example, this is what the array that defines the map for the first bonus phase round looks like:

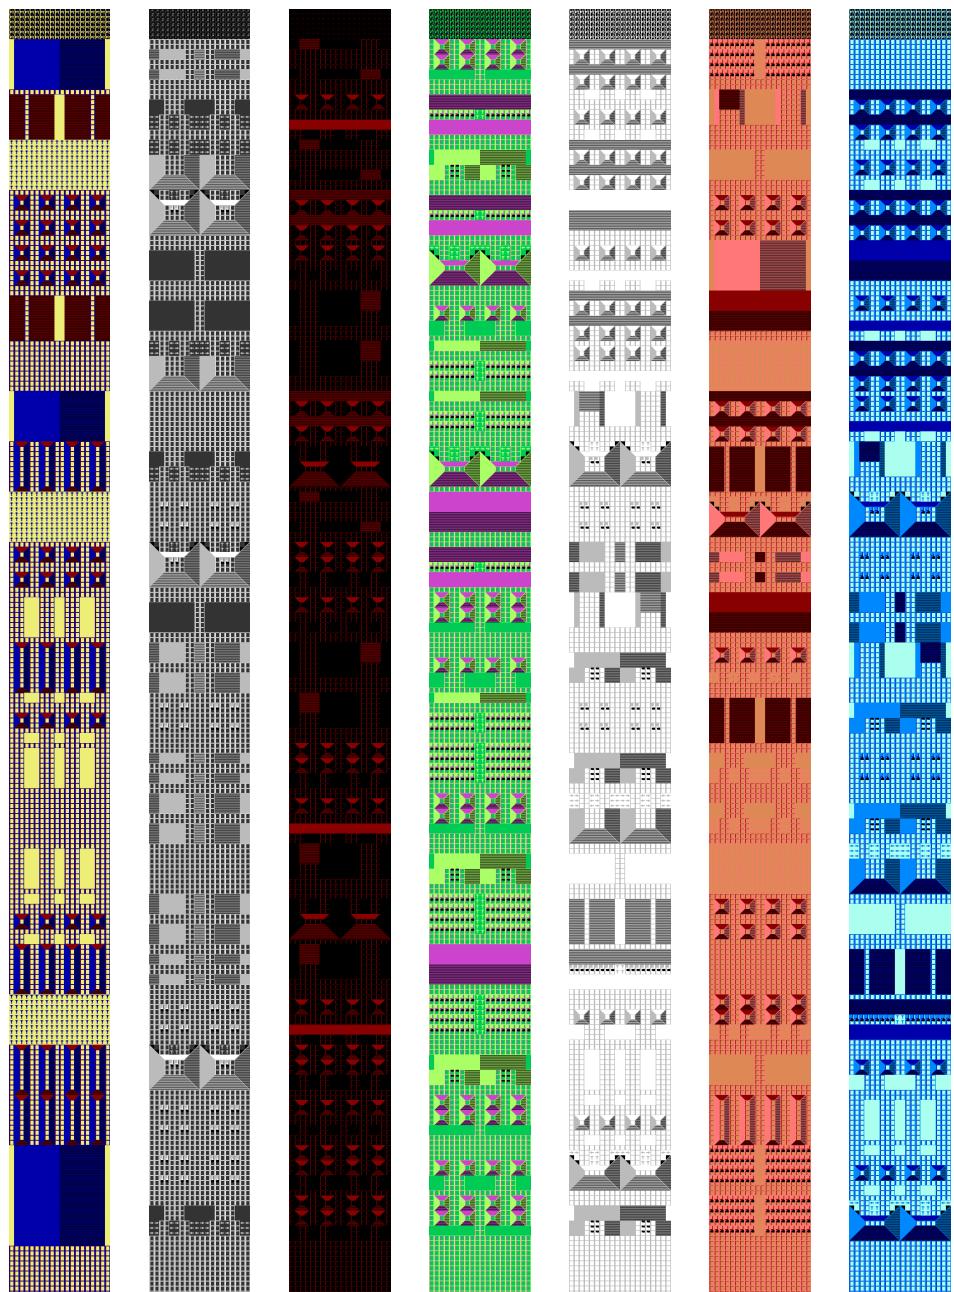

Figure 8.6: The first seven maps used by the bonus phase round.

```

bonusPhaseMapDefinition
.BYTE $00,$00,$00,$00,$00,$00,$00,$00,$00,$00
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $13,$13,$13,$13,$13,$13,$13,$13,$13,$13
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $14,$14,$00,$15,$16,$17,$00,$00,$14,$14
.BYTE $00,$14,$14,$14,$14,$14,$14,$14,$14,$00
.BYTE $00,$00,$00,$00,$00,$00,$00,$00,$00,$00
.BYTE $00,$14,$14,$14,$14,$14,$14,$14,$14,$00
.BYTE $14,$14,$00,$15,$16,$17,$00,$00,$14,$14
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $00,$14,$14,$14,$14,$14,$14,$14,$14,$00
.BYTE $00,$15,$16,$17,$00,$00,$15,$16,$17,$00
.BYTE $13,$13,$13,$13,$13,$13,$13,$13,$13,$13
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $00,$00,$00,$00,$00,$00,$00,$00,$00,$00
.BYTE $12,$12,$12,$12,$12,$12,$12,$12,$12,$00
.BYTE $00,$15,$16,$17,$00,$00,$15,$16,$17,$00
.BYTE $00,$15,$16,$17,$00,$00,$15,$16,$17,$00
.BYTE $13,$13,$13,$13,$13,$13,$13,$13,$13,$13
.BYTE $12,$12,$12,$12,$12,$12,$12,$12,$12,$00
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $10,$10,$10,$10,$10,$10,$10,$10,$10,$10

```

This map definition starts from the bottom up, it does this because we are scrolling upward so it makes sense to begin with what the player will see first. The start of the map is a simple sequence of zeroes:

```

bonusPhaseMapDefinition
.BYTE $00,$00,$00,$00,$00,$00,$00,$00,$00,$00

```

This is the row image each line translates to, a regular square pattern initially followed by rows with some other features.

Index	Image
\$00	
\$00	
\$00	
\$00	
\$00	
\$00	
\$00	
\$00	

Figure 8.7: Snapshot of the map created by the first line definition.

Further along in the definition we reach a segment where some new features are introduced.

```
bonusPhaseMapDefinition
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
```

We can see what each of \$11, \$15, \$16 translate to when we map them to their corresponding images:

Index	Image
\$16	
\$16	
\$15	
\$11	
\$11	

Figure 8.8: Snapshot of the map created by the first line definition.

So how do we get from a value like \$15 to an image that represents a row on the screen?

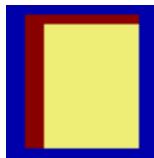

Index	Image
\$15	

We do this by defining each row with yet another array of bytes. In all we define 32 rows of different types so when we come up with a map for the level we are simply referencing each of these rows by their index in the array. Here is the data structure defining each of the 32 rows:

The one at index \$15 (21 in decimal) is this guy:

```
.BYTE $00,$10,$0B,$11,$00,$00,$10,$0B,$11,$00,$00,$10,$0B,$11,$00,$00,$10,$0B,$11,$00
```

Each byte in this definition represents a square cell of four bytes. So for example, \$00 translates to:

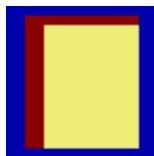

And the first five bytes (which are repeated four times to complete the full row) translate as follows:

So how do we go from a single byte like \$00 to a four-byte square? Would you be surprised if I told you it involved another array of bytes? In fact it involves two arrays of bytes.

```
cellFirstColumnArray
    .BYTE $40,$41,$44,$47,$48,$49,$4F,$4D
    .BYTE $50,$51,$54,$56,$5B,$59,$5C,$5D
    .BYTE $60,$61,$64,$65,$68,$69,$47,$47
    .BYTE $4E,$4E,$57,$57,$5D,$5D,$20,$20
    .BYTE $5D,$45,$4B,$47,$4C,$5D,$4E,$52
    .BYTE $7C,$7D,$6C,$6D,$70,$71,$74,$75
    .BYTE $78,$79
cellSecondColumnArray
    .BYTE $42,$43,$46,$47,$4A,$48,$4E,$4F
    .BYTE $51,$53,$56,$57,$5A,$5B,$5E,$5C
    .BYTE $61,$63,$66,$67,$6A,$6B,$47,$47
    .BYTE $4E,$4E,$57,$57,$5D,$5D,$20,$20
    .BYTE $45,$47,$57,$4B,$4E,$4C,$52,$57
    .BYTE $7E,$7F,$6E,$6F,$72,$73,$76,$77
    .BYTE $7A,$7B
```

So let's look at how we get from \$00 to ...

.. using the two arrays above. The value \$00 is treated as an index into each array, so it points us to the first byte in each. However we're not interested in just the first value in each array but the first two. So the bytes that we will use to construct the 4-byte square are:

```
cellFirstColumnArray
    .BYTE $40,$41
cellSecondColumnArray
    .BYTE $42,$43
```

Each of these bytes is a reference to a byte in the bonus phase character set. When we set out the characters in a table as they are eventually laid out we begin to get a sense of what we must do to turn them into our 4-byte cell:

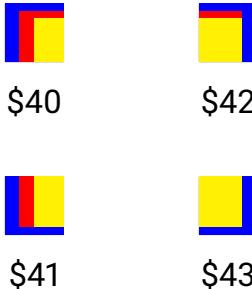

Figure 8.10: Characters making up the four-byte cell referenced by \$00.

What we have done is take the two values at index \$00 in `cellFirstColumnArray` and used each as the first column across two rows. Then we've taken the two values from `cellSecondColumnArray` and used them as the second column across two rows.

Let's repeat this process for the values given by index \$10 highlighted in red.

```
cellFirstColumnArray
    .BYTE $40,$41,$44,$47,$48,$49,$4F,$4D
    .BYTE $50,$51,$54,$56,$5B,$59,$5C,$5D
    .BYTE $60,$61,$64,$65,$68,$69,$47,$47
    ...
cellSecondColumnArray
    .BYTE $42,$43,$46,$47,$4A,$48,$4E,$4F
    .BYTE $51,$53,$56,$57,$5A,$5B,$5E,$5C
    .BYTE $61,$63,$66,$67,$6A,$6B,$47,$47
    ...
```

The values at index \$10 in `cellFirstColumnArray` are \$60, \$61 and in `cellSecondColumn-`

Array are \$61, \$63. Translated to row and column position this gives:

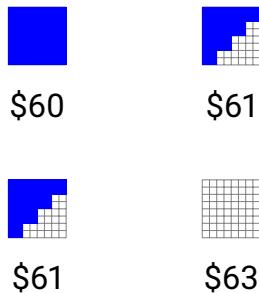

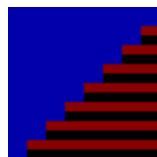

Figure 8.11: Characters making up the four-byte cell referenced by \$10.

Which gives us our second cell..

in the row:

The code that looks after all this is a routine we call `BonusPhaseFillTopLineAfterScrollUp` which is called every time the player scrolls up. There's an equivalent `BonusPhaseFillBottomLineAfterScrollDown` for when the player scrolls down. They're nearly identical.

```

BonusPhaseFillTopLineAfterScrollUp
    LDX offsetForScrollUp
    LDY bonusPhaseMapDefinition,X
    LDA bonusPhaseMapLoPtrArray,Y
    STA bonusPhaseMapLoPtr
    LDA bonusPhaseMapHiPtrArray,Y
    STA bonusPhaseMapHiPtr

    LDY #$00
    LDX #$00
FillRowLoop
    LDA (bonusPhaseMapLoPtr),Y
    STY mapOffsetTemp
    ASL
    CLC
    ADC scrollLineOffset
    TAY
    LDA cellFirstColumnArray,Y
    STA SCREEN_RAM,X
    LDA cellSecondColumnArray,Y
    STA SCREEN_RAM + LINE0_COL1,X
    LDY mapOffsetTemp
    INX
    INX
   INY
    CPY #$14
    BNE FillRowLoop

    LDA scrollLineOffset
    BNE ReturnEarly

    INC offsetForScrollUp
    INC offsetForScrollDown
ReturnEarly
    RTS

```

```

BonusPhaseFillBottomLineAfterScrollDown
    LDX offsetForScrollDown
    LDY bonusPhaseMapDefinition,X
    LDA bonusPhaseMapLoPtrArray,Y
    STA bonusPhaseMapLoPtr
    LDA bonusPhaseMapHiPtrArray,Y
    STA bonusPhaseMapHiPtr

    LDY #$00
    LDX #$00
FillRowLoop
    LDA (bonusPhaseMapLoPtr),Y
    STY mapOffsetTemp
    ASL
    CLC
    ADC scrollLineOffset
    TAY
    LDA cellFirstColumnArray,Y
    STA SCREEN_RAM + LINE18_COL0,X
    LDA cellSecondColumnArray,Y
    STA SCREEN_RAM + LINE18_COL1,X
    LDY mapOffsetTemp
    INX
    INX
   INY
    CPY #$14
    BNE FillRowLoop

    LDA scrollLineOffset
    BEQ FillRowLoop

    DEC offsetForScrollDown
    DEC offsetForScrollUp
    LDA offsetForScrollDown
    CMP #$FF
    BNE ReturnEarly

    LDA #$00
    STA offsetForScrollDown
    LDA #$0A
    STA offsetForScrollUp
ReturnEarly
    RTS

```

The thing to note about this routine is that it only fills one actual line of characters at a time, whereas as the 'rows' we've defined are two lines deep. It decides which of the two lines it's writing by using the `scrollLineOffset` variable to determine which one its writing.

8.2.1 Choosing a Map

So now that we understand how the individual rows of the map are generated, the question arises: how do we procedurally generate entire maps? Do we just pick random rows and join them together? This wouldn't work well, since some rows aren't going to go well together. The solution is to define entire map segments using the building blocks above and let those be the building blocks we use when constructing an entire map.

If we look at our definition for the first bonus phase again we can see it consists of arrays of 10 bytes with each 10-byte array corresponding to a segment in the map and each byte in the array corresponding to a row in the map. So each 10-byte array below gives us a full 20 byte high screen of map data.

```

bonusPhaseMapDefinition
.BYTE $00,$00,$00,$00,$00,$00,$00,$00,$00,$00
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $13,$13,$13,$13,$13,$13,$13,$13,$13,$13
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $14,$14,$00,$15,$16,$17,$00,$00,$14,$14
.BYTE $00,$14,$14,$14,$14,$14,$14,$14,$14,$00
.BYTE $00,$00,$00,$00,$00,$00,$00,$00,$00,$00
.BYTE $00,$14,$14,$14,$14,$14,$14,$14,$14,$00
.BYTE $14,$14,$00,$15,$16,$17,$00,$00,$14,$14
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $00,$14,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $00,$15,$16,$17,$00,$00,$15,$16,$17,$00
.BYTE $13,$13,$13,$13,$13,$13,$13,$13,$13,$13
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $00,$00,$00,$00,$00,$00,$00,$00,$00,$00
.BYTE $12,$12,$12,$12,$12,$12,$12,$12,$12,$00
.BYTE $00,$15,$16,$17,$00,$00,$15,$16,$17,$00
.BYTE $00,$15,$16,$17,$00,$00,$15,$16,$17,$00
.BYTE $13,$13,$13,$13,$13,$13,$13,$13,$13,$13
.BYTE $12,$12,$12,$12,$12,$12,$12,$12,$12,$00
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $10,$10,$10,$10,$10,$10,$10,$10,$10,$10

```

The trick is that these segments aren't themselves generated procedurally, we defined them in advance. We did this in `bonusMapSegmentArray` given below.

```

bonusMapSegmentArray
.BYTE $00,$00,$00,$00,$00,$00,$00,$00,$00,$00
.BYTE $00,$15,$16,$17,$00,$00,$15,$16,$17,$00
.BYTE $00,$14,$14,$14,$14,$14,$14,$14,$14,$00
.BYTE $11,$11,$11,$11,$11,$11,$11,$11,$11,$11
.BYTE $13,$13,$13,$13,$13,$13,$13,$13,$13,$13
.BYTE $12,$12,$12,$12,$12,$12,$12,$12,$12,$00
.BYTE $14,$14,$00,$15,$16,$17,$00,$00,$14,$14
.BYTE $15,$16,$16,$16,$16,$16,$16,$16,$16,$17
.BYTE $00,$00,$00,$00,$00,$00,$00,$00,$00,$00
.BYTE $00,$00,$0F,$0F,$0F,$0F,$0F,$00,$00
.BYTE $01,$01,$01,$01,$00,$00,$01,$01,$01,$01
.BYTE $00,$00,$0B,$0B,$0B,$0C,$0C,$0C,$00,$00
.BYTE $00,$02,$03,$04,$05,$06,$07,$08,$09,$0A
.BYTE $02,$03,$04,$05,$05,$05,$05,$0B,$0B,$0B
.BYTE $00,$00,$01,$01,$00,$00,$01,$01,$00,$00
.BYTE $00,$00,$0E,$0D,$00,$00,$0E,$0D,$00,$00
.BYTE $00,$02,$03,$04,$05,$05,$08,$09,$0A,$0B,$00
.BYTE $00,$00,$00,$1A,$1A,$1A,$18,$18,$18,$18
.BYTE $00,$00,$00,$1A,$1A,$1A,$1A,$19,$19,$19
.BYTE $00,$00,$18,$18,$00,$00,$00,$00,$19,$19

```

```
.BYTE $00,$00,$1B,$1B,$00,$00,$15,$16,$17,$00
.BYTE $15,$16,$17,$1D,$1D,$15,$16,$17,$1D,$1D
.BYTE $14,$14,$1E,$1E,$00,$00,$15,$16,$17,$00
.BYTE $00,$0B,$0B,$0B,$15,$16,$17,$15,$16,$17
.BYTE $00,$00,$1D,$1D,$1D,$1E,$1E,$1E,$1E
.BYTE $00,$00,$20,$1F,$20,$1F,$00,$00,$11,$11
.BYTE $00,$00,$20,$1F,$20,$1F,$20,$1F,$20,$1F
.BYTE $00,$1E,$1E,$1E,$20,$1F,$1D,$1D,$00
.BYTE $00,$0C,$0C,$0C,$15,$16,$17,$00,$00,$00
.BYTE $00,$02,$03,$04,$05,$08,$09,$0A,$0B,$00
.BYTE $00,$00,$06,$06,$06,$11,$11,$11,$00,$00
.BYTE $00,$00,$0F,$0F,$15,$16,$17,$15,$16,$17
```

By way of example this is what the last segment in the list above looks like when rendered as a section of our map (remember to read from back to front):

Index	Image
\$17	
\$16	
\$15	
\$17	
\$16	
\$15	
\$0F	
\$0F	
\$00	
\$00	

So our procedure for generating a map is simply choosing 30 of these segments in a pseudo-random order and stacking them on top of one another!

8.3 Some Very Ugly Sprites

There is no escaping the obvious: the gilby sprite in the bonus phase is impossibly ugly. It's such a contrast with the elegance of the main game's gilby sprite that for me it spoils the effect of the mini-game completely.

There is of course a simple technical reason why the gilby sprite design is completely unsuitable for the vertical orientation used in the bonus phase. Multi-coloured sprites cannot be defined in terms of single pixels - the building blocks are always two pixels wide so it is by definition not possible to create an object oriented on the Y axis that does not look unappealingly blocky.

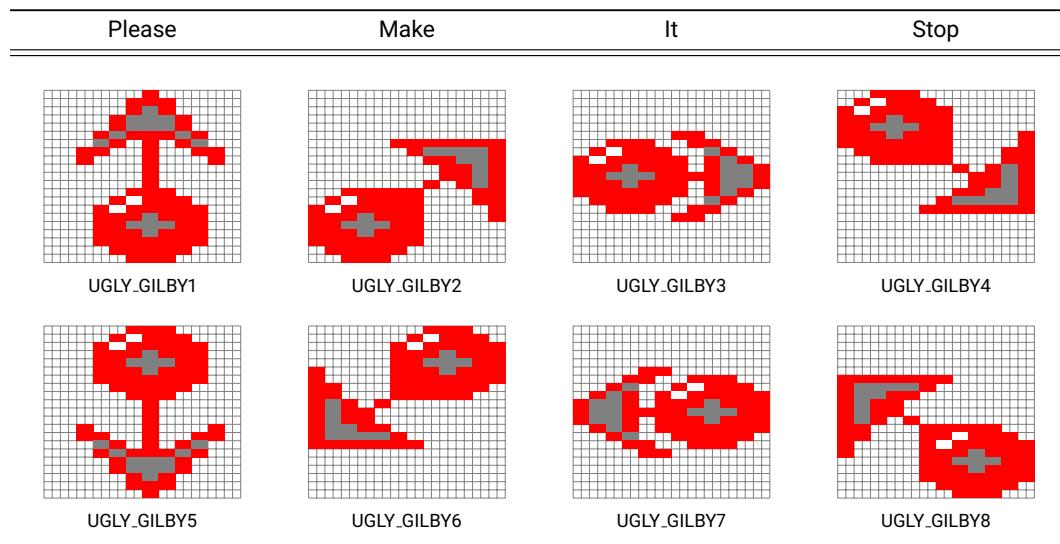

Figure 8.12: There is no excuse for this.

8.4 IBalls

The main adversary in the bonus phase, these at least have the merit of being visually appealing. The blinking animation is particularly pleasing, if a little eerie!

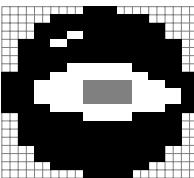

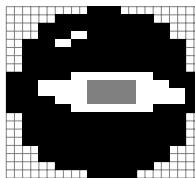

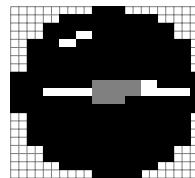

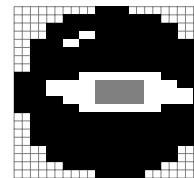

IBall	Another One	A Third	One More
			

Figure 8.13: OK this is better.

A Hundred Thousand Billion Theme Tunes

The theme music in Iridis Alpha is procedurally generated. There isn't a chunk of music data that the game plays every time you visit the title screen. Instead a new tune is generated for every visit. There's a distinction to be made here between procedural and random. The music isn't random: the first time you launch Iridis Alpha, and every subsequent time you launch it, you will hear the same piece of music. But as you let the game's attract mode cycle through and return to the title screen you will hear a new, different piece of music. Iridis Alpha has an infinite number of these tunes and it plays them in the same order every time you launch it and as it loops through the title sequence waiting for you to play.

Because the music is generated procedurally, and not randomly, you will hear the same sequence of tunes every time you launch the game so it appears to you as if the music was composed in advance and stored in the game waiting its turn. This is not the case.

Each piece of music is generated dynamically using the same algorithm but because the logic is chaotic enough, the smallest difference in the initial values fed into it will result in a completely different tune being generated.

The routine responsible for creating this music is remarkably short so I've reproduced it here in full before we start to dive in and try to understand what's going on.

```
PlayTitleScreenMusic
    DEC baseNoteDuration

Listing 9.1: Routine responsible for playing the title tune.

9.1 Some Basics

The rudiments of playing music on the Commodore 64 are simple. It has a powerful-for-its-time sound chip that has 3 tracks or 'voices'. You can play any note across 8 octaves on each of these voices together or separately. There are a whole bunch of settings you can apply to each voice to determine the way the note sounds. We'll cover a couple of these settings here but when it comes to playing music these extra settings aren't so important. They're much more useful when generating sound effects.

Playing a note on one of the voices consists of loading a two-byte value into the location (or 'register') associated with that voice. Here's the routine in Iridis used to play a note for the theme tune on Voice '1':

```
PlayNoteVoice1
    LDA #$21
    STA $D404      ;Voice 1: Control Register
    LDA titleMusicLowBytes,Y
    STA $D400      ;Voice 1: Frequency Control - Low-Byte
    LDA titleMusicHiBytes,Y
    STA $D401      ;Voice 1: Frequency Control - High-Byte
    RTS
```

Listing 9.2: Plays a note on Voice 1. The routine is supplied with a value in Y that indexes into two arrays containing the first (Hi) and second (Lo) byte respectively associated with the selected note.

Once the selected bytes have been loaded into \$D400 and \$D401 the new note will start playing. It's as blunt an instrument as that. (Well not quite, we'll cover some other gory details soon).

The full list of available notes is given in the C64 Progammer's Reference Manual. I've adapted and reproduced it below.

Octave	Note	High Byte	Low Byte	Octave	Note	High Byte	Low Byte	Octave	Note	High Byte	Low Byte
0 C	\$01	\$0C		2 G#	\$06	\$A7		5 E	\$2A	\$3E

2 G	\$06	\$47		5 D#	\$27	\$DF		7 B	\$FD	\$2E	

Figure 9.1: All available notes on the C64 and their corresponding hi/lo byte values. Note that Iridis Alpha only uses octaves 3 to 7. The available notes in octaves 1 to 2 are never used.

With 96 notes in total available, Iridis only uses 72 of them, omitting the 2 lowest octaves. We can see this when we look at the note table in the game. This pair of arrays are where the title music logic plucks the note to be played once it has dynamically selected one:

```
titleMusicHiBytes
;      C   C#   D   D#   E   F   F#   G   G#   A   A#   B
.BYTE $08,$08,$09,$09,$0A,$0B,$0B,$0C,$0D,$0E,$0E,$0F ; 4
.BYTE $10,$11,$12,$13,$15,$16,$17,$19,$1A,$1C,$1D,$1F ; 5
.BYTE $21,$23,$25,$27,$2A,$2C,$2F,$32,$35,$38,$3B,$3F ; 6
.BYTE $43,$47,$4B,$4F,$54,$59,$5E,$64,$6A,$70,$77,$7E ; 7
.BYTE $86,$8E,$96,$9F,$A8,$B3,$BD,$C8,$D4,$E1,$EE,$FD ; 8
```

```

titleMusicLowBytes
;          C   C#   D   D#   E   F   F#   G   G#   A   A#   B
.Byte $61,$E1,$68,$F7,$8F,$30,$DA,$8F,$4E,$18,$EF,$D2 ; 4
.Byte $C3,$C3,$D1,$EF,$1F,$60,$B5,$1E,$9C,$31,$DF,$A5 ; 5
.Byte $87,$86,$A2,$DF,$3E,$C1,$6B,$3C,$39,$63,$BE,$4B ; 6
.Byte $0F,$0C,$45,$BF,$7D,$83,$D6,$79,$73,$C7,$7C,$97 ; 7
.Byte $1E,$18,$8B,$7E,$FA,$06,$AC,$F3,$E6,$8F,$F8,$2E ; 8

```

Listing 9.3: The lookup table for all of the notes used in the theme music. The two lowest available octaves are not used by the game. To see this for yourself compare the first entry in titleMusicHiBytes/titleMusicLowBytes (\$08 and \$61 giving \$0861) with the entry highlighted in red in the previous table.

So now that we know where the notes are and how to make them go beep we just have to figure out the order that PlayTitleScreenMusic contrives to play them.

It would certainly help if we could see what the music looks like, so lets do that. Here is the opening title tune as sheet music in Western notation.

Procedurally Generated

Iridis Alpha Title Theme
1 of 100,000,000,000,000

(Sid.)
Jeff Minter

Figure 9.2: The first title tune in Iridis Alpha.

9.1.1 Structure

Even if you can't read sheet music notation some structure should be evident.

Voice 3 carries the main melody.

Iridis Alpha: 1 of 100,000,000,000,000
First 4 Bars of Voice 3

For every 4 notes Voice 3 plays, Voice 2 chimes in with a new note that it sustains until the next one.

Iridis Alpha: 1 of 100,000,000,000,000
First 4 Bars of Voice 3 and Voice 2

Musical notation for the first 4 bars of Voices 2 and 3. Voice 3 continues its eighth-note pattern. Voice 2 enters on the fourth beat of each measure, playing a single sustained note (B) that overlaps with the start of the next measure's pattern.

Voice 1 does the same for every 16 notes that Voice 3 plays and every 4 notes of Voice 2..

Iridis Alpha: 1 of 100,000,000,000,000
Voice 1, 2 and 3.

Musical notation for the first 4 bars of Voices 1, 2, and 3. Voice 3 continues its eighth-note pattern. Voice 2 enters on the fourth beat of each measure. Voice 1 enters on the 17th note of the sequence, which corresponds to the 4th note of Voice 3's pattern, and plays a sustained note (B) that overlaps with the start of the next measure's pattern.

Armed with this insight we can see it reflected in the logic in `PlayTitleScreenMusic`. This routine is called regularly by a system interrupt, a periodic wake-up call performed by the C64 CPU. So multiple times every second it is run and must figure out what new notes, if any, to play on each of the three voices.

Here it is deciding whether or not to play new note on Voice 1:

```
MaybePlayVoice1
DEC voice1NoteDuration
```

```
BNE MaybePlayVoice2
LDA #$30
STA voice1NoteDuration

LDX voice1IndexToMusicNoteArray
LDA titleMusicNoteArray,X
CLC
ADC offsetForNextVoice1Note
TAY
STY offsetForNextVoice2Note

JSR PlayNoteVoice1

INX
TXA
AND #$03
STA voice1IndexToMusicNoteArray
```

Listing 9.4: MaybePlayVoice1 part of PlayTitleScreenMusic.

voice1NoteDuration is used to count the interval between notes on Voice 1. It's decremented on each visit and when it reaches zero it gets reset to 48 (\$30) and a note is played. What's being counted here isn't seconds, it's cycles or 'interrupts'. So this translates to only a few seconds between notes being played.

The same is done for both Voice 2 and Voice 3 but the intervals are shorter: 12 (\$0C) and 3 (\$03). This matches the relationship we see in the sheet music, one note in Voice 1 for every sixteen in Voice 3 ($48/3=16$) and one note in Voice 2 for every four in Voice 3 ($12/3=4$).

```
MaybePlayVoice2
DEC voice2NoteDuration
BNE MaybePlayVoice3

LDA #$0C
STA voice2NoteDuration
LDX voice2IndexToMusicNoteArray
LDA titleMusicNoteArray,X
CLC
ADC offsetForNextVoice2Note

; Use this new value to change the key of the next four
; notes played by voice 3.
STA offsetForNextVoice3Note

TAY
JSR PlayNoteVoice2
INX
TXA
AND #$03
STA voice2IndexToMusicNoteArray
```

Listing 9.5: MaybePlayVoice2 part of PlayTitleScreenMusic.

```
MaybePlayVoice3
DEC voice3NoteDuration
BNE ReturnFromTitleScreenMusic

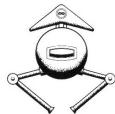

LDA #$03
STA voice3NoteDuration

; Play the note currently pointed to by
; voice3IndexToMusicNoteArray in titleMusicNoteArray.
LDX voice3IndexToMusicNoteArray
LDA titleMusicNoteArray,X
CLC
ADC offsetForNextVoice3Note
TAY
JSR PlayNoteVoice3

; Move voice3IndexToMusicNoteArray to the next
; position in titleMusicNoteArray.
INX
TXA
; Since it's only 4 bytes long ensure we wrap
; back to 0 if it's greater than 3.
AND #$03
STA voice3IndexToMusicNoteArray
```

Listing 9.6: MaybePlayVoice3 part of PlayTitleScreenMusic.

Extracting the Title Music

Since each tune is dynamically generated there's nowhere for us to pull them from. We could record the tunes as audio files and maybe extract something useful that way. A feature of Vice, the C64 emulator, allows us to do something much simpler. We can log every note that's played to a text file and use that trace to reconstruct the tunes.

We launch Iridis Alpha with x64 using the following command:

```
x64 -moncommands moncommands.txt orig/iridisalpha.prg
```

The `moncommands.txt` file contains a series of debugger directives that tells `x64` to log every value stored to the music registers at `$D400-$D415`. This will capture all notes played on all three voices as well as any updates made to the other sound parameters and write them to `IridisAlphaTitleMusicAll.txt`:

```
log on
logname "IridisAlphaTitleMusicAll.txt"
tr store D400 D415
```

We end up with `IridisAlphaTitleMusicAll.txt` full of lines like:

```
TRACE: 1 C:$d400-$d415 (Trace store)
#1 (Trace store d400) 279 052
.C:1598 8D 00 D4 STA $D400 - A:61 X:00 Y:00 SP:e8 96135469
#1 (Trace store d401) 279 060
.C:159e 8D 01 D4 STA $D401 - A:08 X:00 Y:00 SP:e8 96135477
#1 (Trace store d40b) 280 059
```

This snippet gives us the value in `A` written to each register for Voice 1. For example, `$61` has been written to `$D400` and `$08` has been written to `$D401`.

We can now write a short Python notebook that parses this file and for each tune constructs three arrays, each representing a voice, with the sequence of notes played to each. For example, in the extract above we can extract `$0861` as the note 'C' in octave 3 played on Voice 1 (`$D400-$D401`). (Refer to the tables above to see why `$0861` translates to 'C-3').

With the sequence of notes in three arrays, each representing one of the 3 voices, it is a simple matter to transform this into ABC format, a music notation frequently used for traditional music.

Listing 9.7: Title Tune No 1 in ABC format

We can then use the tool abc2ps to transform this into an SVG image file giving the music in standard Western notation.

9.1.2 Phrasing

Now that we've identified the underlying 4-bar structure of the arrangement. We can take a closer look at the phrasing of the individual parts. Voice 3 has a simple repetitive structure for each 4-bar phrase:

Iridis Alpha: 1 of 100,000,000,000,000
 Three 4-bar phrases from Voice 3.

Figure 9.3: Bars 2 and 4 are always repeated

Bars 2 and 4 are repeated. Each bar consists of the same tonic formula: three notes rising two notes at a time, falling back on the final note. The difference between bars 1 and 3 is a simple key change.

This 4 note basis is driven by the 4 bytes in `titleMusicNoteArray`. Generating the music for Voice 3 consists of calculating and loading 4 values into this array and using them as an index into `titleMusicLowBytes/titleMusicHiBytes` to play the actual note.

```
; This seeds the title music. Playing around with these first
; four bytes alters the first few seconds of the title music.
; The routine for the title music uses these 4 bytes to determine
; the notes to play.
; This array is periodically replenished from titleMusicSeedArray by
; SelectNewNotesToPlay.
titleMusicNoteArray .BYTE $00,$07,$0C,$07
```

Notice how the values populated in `titleMusicNoteArray` at start-up match the structure of our basic tonic formula, e.g. C3-G3-C4-G3.

<code>titleMusicNoteArray</code>	<code>titleMusicHiBytes</code>	<code>titleMusicLowBytes</code>	Note
\$00	\$08	\$61	C-3
\$07	\$8F	\$0C	G-3
\$0C	\$C3	\$10	G-3
\$07	\$8F	\$0C	G-3

Figure 9.4: The value in `titleMusicNoteArray` is an index into `titleMusicHiBytes/titleMusicLowBytes`.

Playing the 4 note phrase we've stored in this array is done here:

```
; Play the note currently pointed to by
; voice3IndexToMusicNoteArray in titleMusicNoteArray.
LDX voice3IndexToMusicNoteArray
LDA titleMusicNoteArray,X
CLC
ADC offsetForNextVoice3Note
TAY
JSR PlayNoteVoice3
```

The variable that's doing a bit of extra work here is `offsetForNextVoice3Note`. This is what's shifting the notes for subsequent bars from the base position of C3-G3-C4-G3 to G3-D4-G4-D4. This value has to get updated after every four notes, otherwise we just keep playing the same four notes over and over again.

The obvious place to do this is when play a note on Voice 2, which is something we're already doing every 4 notes in Voice 3.

```
MaybePlayVoice2
    DEC voice2NoteDuration
    BNE MaybePlayVoice3

    LDA #$0C
    STA voice2NoteDuration
    LDX voice2IndexToMusicNoteArray
    LDA titleMusicNoteArray,X
    CLC
    ADC offsetForNextVoice2Note

    ; Use this new value to change the key of the next four
    ; notes played by voice 3.
    STA offsetForNextVoice3Note

    TAY
    JSR PlayNoteVoice2
    INX
    TXA
    AND #$03
    STA voice2IndexToMusicNoteArray
```

As we can see the mechanics of playing a note for Voice 2 are otherwise the same as Voice 3. We're playing the same phrase encoded in `titleMusicNoteArray` that is played by Voice 3 but just over a longer period of time. And if you look closely again at the first four bars of the first title tune you can see that Voice 2 is in fact playing the exact same 4 notes of the first bar of Voice 3.

Iridis Alpha: 1 of 100,000,000,000,000
Voice 1, 2 and 3.

A musical score for three voices (Voice 1, Voice 2, Voice 3) over 4 bars. Voice 1 starts with a long note followed by a short note. Voice 2 starts with a short note followed by a long note. Voice 3 starts with a short note followed by a long note. A red box highlights the first bar of Voice 3. A blue box highlights the first four bars of Voice 1.

The same thing happens for Voice 1: it is playing the same notes as the first bar of Voice 3 but over 16 bars (1 every 4 bars).

So ultimately what we have underlying every tune generated by Iridis Alpha is a 16-bar structure where the same 4 notes are played by Voice 3 in its first bar, Voice 2 in its first 4 bars, and Voice 1 over the full 16 bars. This structure recurs every 16 bars, each time using the 4 initial notes from Voice 3.

Iridis Alpha: 14 of 100,000,000,000,000
The 16 Bar Basic Structure.

A musical score for three voices (Voice 1, Voice 2, Voice 3) over 16 bars. The score shows nested structures where Voice 3's 4-note pattern is picked up by Voice 2, and Voice 2's 4-note pattern is picked up by Voice 1. The score consists of two staves of 8 bars each, separated by a double bar line with repeat dots.

Figure 9.5: A full 16 bar passage showing the nested structure of Voices 1 and 2

This is a nested structure with the initial musical phrase that occurs every 4 bars in Voice 3 being picked up by Voice 2 and the one that occurs at every 16th bar being picked up by Voice 1.

The second, finer-grained structure of each tune lies in Voice 3 and consists of selecting a fundamental 4 note pattern (as we discussed above) and applying that same pattern to the key change between each 4 note phrase!

Iridis Alpha: 1 of 100,000,000,000,000
 First 16 bars of Voice 3.

Figure 9.6: The G3-C4-G4-C4 pattern used to construct the 4 note pattern is also used to construct the key changes in each 4-bar sequence (red-blue-green-blue).

This is why we observed the repeating structure of Bars 2 and 4 earlier! It's the same pattern used to construct the 4 note formula.

But how do we choose the key for the start of each 4-bar pattern? By applying the same pattern to the start of each 4-bar section!

Iridis Alpha: 1 of 100,000,000,000,000
 First 16 bars of Voice 3.

Figure 9.7: The start of each 4 bar pattern in a 16 bar cycle uses each of the 4-note patterns from the first 4 bars.

If we look at two other procedurally generated tunes we can see the same pattern:

Iridis Alpha: 12 of 100,000,000,000,000

Four 4-bar phrases from Voice 3.

Iridis Alpha: 18 of 100,000,000,000,000

Four 4-bar phrases from Voice 3.

Figure 9.8: The same patterns in Tunes 12 and 18.

9.1.3 Seeding the Random

We've established how each tune is built entirely off the same 4-byte sequence, all the way from selecting notes to play to filling out the larger structure of the tune at almost every level. What remains is to see how this 4-byte sequence is selected. We know it's not entirely random since if it was, none of us would ever hear the same tune.

The selection of our 4-byte structure for each tune happens in `SelectNewNotesToPlay`. Once a seed value has been plucked, this is used as an index into `titleMusicSeedArray` and the next four values are populated into our magic 4-byte sequence that determines everything `titleMusicNoteArray`.

```

SelectNewNotesToPlay
    ; Get a random value between 0 and 15.
    JSR PutProceduralByteInAccumulator
    AND #$0F
    ; Jump to InitializeSeedLoop if it's zero.
    BEQ InitializeSeedLoop

    ; Otherwise multiply it by 4. We do this so that
    ; the 4-byte sequence we choose always starts at
    ; a 4-byte offset in titleMusicSeedArray.
    TAX
    LDA #$00
MultiplyRandomNumBy4
    CLC
    ADC #$04
    DEX
    BNE MultiplyRandomNumBy4

```

Listing 9.8: Put a seed byte in the accumulator and multiply this by 4 if it's not zero. This gives us what we need for the next step.

```

InitializeSeedLoop
    ; Put our random number in Y and use it as index into
    ; the seed array.
    TAY
    ; Initialize X to 0, we will use this to iterate up to
    ; 4 bytes for pulling from titleMusicSeedArray.
    LDX #$00

    ; Pick the first 4 bytes in titleMusicSeedArray from our
    ; randomly chosen offset and put them in
    ; titleMusicNoteArray.
MusicSeedArrayLoop
    LDA titleMusicSeedArray,Y
    STA titleMusicNoteArray,X
    INY
    INX
    CPX #$04
    BNE MusicSeedArrayLoop

```

Listing 9.9: Use our seed value to pull 4 bytes from titleMusicSeedArray and store them in titleMusicNoteArray

```

; This is used to replenish titleMusicNoteArray with seed values
; for the procedurally generated title screen music.
titleMusicSeedArray .BYTE $00,$03,$06,$08
                    .BYTE $00,$0C,$04,$08
                    .BYTE $00,$07,$00,$05
                    .BYTE $05,$00,$00,$05
                    .BYTE $00,$06,$09,$05
                    .BYTE $02,$04,$03,$04
                    .BYTE $03,$07,$03,$00
                    .BYTE $04,$08,$0C,$09

```

```
.BYTE $07,$08,$04,$07  
.BYTE $00,$04,$07,$0E  
.BYTE $00,$00,$00,$07  
.BYTE $07,$04,$00,$0C  
.BYTE $04,$07,$00,$0C  
.BYTE $07,$08,$0A,$08  
.BYTE $0C,$00,$0C,$03  
.BYTE $0C,$03,$07,$00
```

Listing 9.10: Our seed bank for 4-byte sequences. It's 64 bytes long giving 16 possible sequences in all.

The real source of variety here is this 'seed value' that we pluck at the very start of the process. This is done by `PutProceduralByteInAccumulator` at the very start of `SelectNewNotesToPlay`.

```
;-----  
; PutProceduralByteInAccumulator  
; This function is self-modifying. Every time it  
; is called it increments the address that  
; sourceOfSeedBytes points to. Since sourceOfSeedBytes  
; initially points to $9A00, it will point to $9A01  
; after the first time it's called, $9A02 after the  
; second time it's called - and so on.  
;  
PutProceduralByteInAccumulator  
srcOfProceduralBytes    =**$01  
    LDA sourceOfSeedBytes  
    INC srcOfProceduralBytes  
    RTS
```

Listing 9.11: Our seed value ultimately comes from `sourceOfSeedBytes`.

And `sourceOfSeedBytes` turns out to be a string of 256 random-looking data at \$9A00:

```
*=$9A00  
sourceOfSeedBytes  
.BYTE $E0,$D3,$33,$1F,$BF,$EC,$EF,$3E  
.BYTE $FA,$70,$DA,$26,$87,$C2,$C9,$9C  
.BYTE $F7,$FB,$C8,$85,$C1,$A9,$64,$AD  
.BYTE $6B,$DE,$8B,$8F,$05,$5E,$54,$51  
.BYTE $78,$0A,$6E,$6F,$FD,$0C,$A5,$32  
.BYTE $F5,$56,$44,$75,$38,$D6,$23,$98  
.BYTE $61,$D5,$49,$C6,$F2,$95,$BA,$08  
.BYTE $C3,$3D,$F4,$F0,$21,$48,$84,$02  
.BYTE $7E,$5B,$68,$55,$04,$92,$AE,$34  
.BYTE $72,$F6,$71,$A1,$39,$4F,$74,$E5  
.BYTE $E8,$31,$9A,$C7,$E3,$86,$6D,$14  
.BYTE $60,$CD,$50,$FF,$82,$52,$66,$9E  
.BYTE $E9,$53,$25,$93,$07,$77,$2E,$D7  
.BYTE $1A,$62,$80,$B7,$0D,$1B,$15,$46  
.BYTE $CE,$AA,$47,$24,$8D,$E1,$18,$67  
.BYTE $6A,$4A,$F1,$B9,$D0,$91,$BC,$EE
```

```
.BYTE $B5,$D1,$7B,$A0,$DB,$36,$45,$E7  
.BYTE $11,$22,$81,$FC,$58,$30,$28,$CB  
.BYTE $8C,$B1,$0B,$A7,$DC,$B4,$9D,$57  
.BYTE $B3,$ED,$3C,$43,$16,$8A,$EA,$D8  
.BYTE $0E,$89,$1D,$1E,$DF,$9F,$BD,$BB  
.BYTE $F9,$D9,$01,$3B,$7A,$BE,$69,$B8  
.BYTE $5A,$A6,$E2,$96,$F8,$AC,$6C,$12  
.BYTE $2D,$19,$2A
```

Listing 9.12: Our seed value ultimately comes from `sourceOfSeedBytes`.

As you might have guessed by now, given that there are only 16 possible sequences to choose from the seed bank there must actually be a lot less than a hundred thousand billion possible them tunes. With only 16 sequences there may even be only 16!

Well yes, there are certainly a lot closer to just 16 than a hundred thousand billion. The variety of values we get from `sourceOfSeedBytes` is not really of any account in the number of tunes we can generate. We're just using it to get pseudo-random but relatively predictable values between 0 and 15 and using that to choose one of the 16 4-byte 'tune seeds'.

There's an additional bit of variability that gives us more than just 16 tunes though. This is the value we add to the note's index before we play it:

```
MaybePlayVoice1  
    DEC voice1NoteDuration  
    BNE MaybePlayVoice2  
  
    LDA #$30  
    STA voice1NoteDuration  
  
    LDX voice1IndexToMusicNoteArray  
    LDA titleMusicNoteArray,X  
    CLC  
    ADC offsetForNextVoice1Note  
    TAY  
    STY offsetForNextVoice2Note
```

Listing 9.13: `offsetForNextVoice1Note` introduces additional tune permutations.

When we select a new tune the value `offsetForNextVoice1Note` may be carrying over a value from the previous tune so rather than be a consistent value every time the 'tune seed' is selected, it will vary in value. The result is that the logic will select a different note-group even though it used the same 4-byte 'tune seed'.

Since the value in `offsetForNextVoice1Note` is ultimately loaded from `titleMusicSeedArray`:

```
LDX notesPlayedSinceLastKeyChange  
LDA titleMusicNoteArray,X
```

```
STA offsetForNextVoice1Note
```

Listing 9.14: `offsetForNextVoice1Note` is loaded from `titleMusicNoteArray` and is propagated down to `offsetForNextVoice3Note`.

In practice there are 16 possible voice note sequences and 12 unique possible byte values to load from `titleMusicSeedArray` so there are 192 possible tunes.

[I can only get it to generate 80 so I'm missing something here.]

So the Hundred Thousand Billion is a lie. Iridis will indeed play a hundred thousand billion times if you leave it running long enough but ultimately even when we account for variations in key it can only ever play 192 unique title tunes.

Sorry for getting your hopes up.

Another 16^4 Tunes

It's possible to dig into the making of the title music and how Jeff Minter arrived at the music configuration he did thanks to a number of tiny demo programs that survive from the period when he was developing Iridis Alpha.

Jeff distributed these little toys on 'CompuNet' in the summer of 1986. 'CompuNet' was a predecessor to the modern internet that enabled C64 users with the equipment and determination to dial up a local computer server over telephone landlines. Once dialled in, they could participate in message boards and exchange and download files such as the little prg demos that Jeff Minter created here, [torus.prg](#) and [torus2.prg](#).

It turns out that Minter was heavily inspired by an article in 'Byte' magazine from June 1986. This article, 'Musical Fractals' by Charles Dodge and Curtis Bahn outlined a version of the algorithm that Jeff ultimately adopted. The 'self-similarity' we encountered in the way the Iridis Alpha theme tunes are constructed, a four-note structure repeated across different time intervals on each of the three voices, finds its roots in this article. The basic concept of layering we encountered in the previous chapter is illustrated using a tree diagram. The musical phrase played at the top-most level is spread out in time in the levels above:

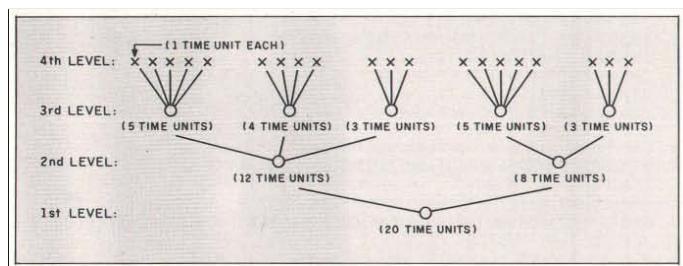

Figure 10.1: The layering of the same notes across different time intervals, from '[Musical Fractals](#)'

The listings given in the article were in BASIC and inscrutable to anything but the most minute attention:

Listing 10.1: A snippet from VARIATN.BAS a program for determinate fractal and Brownian variation.

```

200 REM FRACTAL ROUTINE
205 PRINT "COMPUTING FRACTAL"
210 FOR Am1 TO PN
220 AP(A)=P(A)+RC:AD(A)=D(A)
230 FOR 131 TO PN
240 BC=BC+1: IF R < 1 THEN GOSUB 700
245 BP(BC).AP(A)+P(B)+RC:BD(BC).D(B)*D(A)
250 FOR 0.1 TO PN
260 CC.CC+1:IF R.1 THEN GOSUB 700
270 CP(CC).1111,(BC)+P(C)+RC:CD(CC).D(C)*BEI(BC):DT.DT+GD(CG)
280 NEXT C: NEXT B: NEXT A

```

Certainly, Minter must have experimented with them in order to arrive at his own version of fractal music. But it seems much more likely that what caught his eye were patterns such as this one, which in a way make the general idea obvious and intuitive to the casual reader:

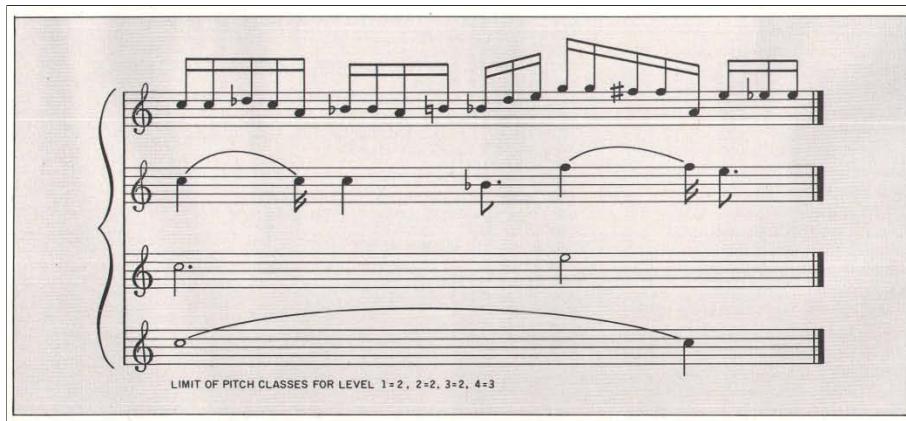

Figure 10.2: A pattern that looks familiar from our notation of Iridis Alpha's title music, from '[Musical Fractals](#)'

10.1 Taurus:Torus

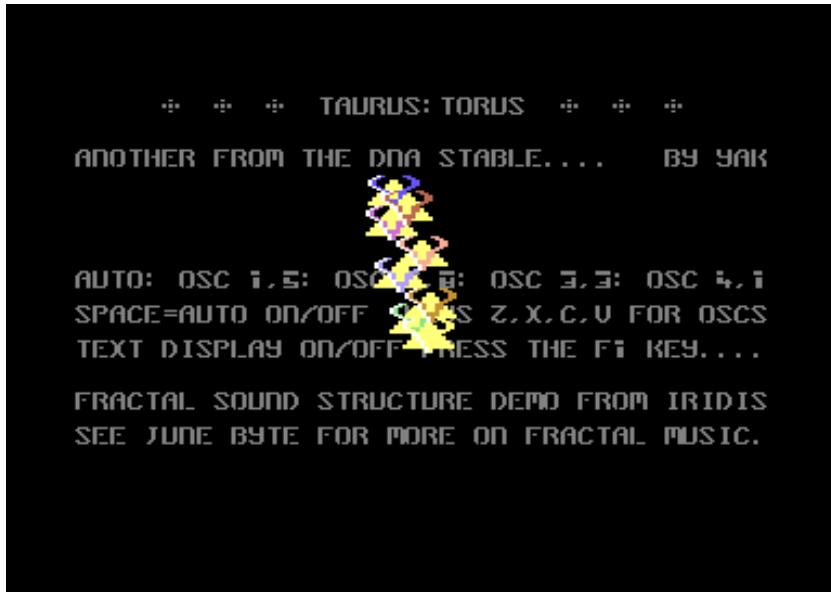

Figure 10.3: The splash screen for the Taurus:Torus demo.

This first demo, released in July 1986, has a version of Iridis' music-generating algorithm that is nearly fully formed. However, the music it produces is quite different. In fact, it is nearer to a tool for listening to and selecting music than anything else.

The four seed values in `titleMusicNoteArray` that are used to seed all subsequently generated tunes (00 07 0C 07 in Iridis Alpha) can be selected and changed by the user. They're called 'Oscillators' and each can be any value between 0 and 16, i.e. any of 0 1 2 3 4 5 6 7 8 9 A B C D E F.

If we compare the title screen music routine from Iridis Alpha and the routine we find in Taurus :Torus we can see that we have a fractal-like self-similarity between the two going on. There are in fact only two points of difference, see if you can spot them by glancing through the listings side by side:

Listing 10.2: The music routine in Torus:Taurus side-by-side with Iridis Alpha.

The Iridis Alpha routine has an extra step. At the very start it has a trapdoor for bailing out. This allows it control the duration of the notes selected for playing:

```
PlayTitleScreenMusic
    DEC baseNoteDuration
    BEQ MaybeStartNewTune
    RTS

MaybeStartNewTune
    LDA previousBaseNoteDuration
    STA baseNoteDuration
```

The second difference lies in the placement of JSR SelectNewNotesToPlay. The Torus demo selects new procedurally generated notes at every visit, whereas the Iridis Alpha version only selects new notes at the beginning of a new 16 bar structure.

```
; We'll only select a new tune when
; we've reached the beginning of a
; new 16 bar structure.
INX
TXA
AND #$03
STA notesPlayedSinceLastKeyChange
BNE MaybePlayVoice1

JSR SelectNewNotesToPlay
```

When it runs, the demo cycles through procedural configurations of titleMusicNoteArray of 64 notes each. In other words, exactly the kind of fractal structure we observed in Iridis Alpha proper. The examples below give a flavour of the music it generates:

CHAPTER 10. ANOTHER 16^4 TUNES

Procedurally Generated

Torus:Taurus Tune

(Sid.)
Jeff Minter

1 of 100,000,000,000,000

Voice 1

Voice 2

Voice 3

Figure 10.4: A pattern familiar from our discussion of the main title's music.

As before, the key to understanding the principle in operation here is that the four notes played by the entirety of 'Voice 1' are played in the first four bars of 'Voice 2', and the first single bar of 'Voice 3'. The notes from each voice seed the notes selected for the other voices. Just as in our discussion of the title tunes, the initial parameters chosen have a chaotic effect on the notes that are eventually played resulting in radically different tunes from just small adjustments in initial values.

10.2 A Graphical Interlude: Oscillator in 4 Parts

Before we move on from Torus:Taurus, let's take a brief graphical diversion. This demo was also the laboratory where the elegant animation used when awarding a bonus was developed.

Figure 10.6: The Torus oscillator animation and Iridis' bonus animation.

Figure 10.7: The sprites used in the Iridis Alpha bonus phase and the Torus demo.

The code handling each is identical and was only very lightly modified for the final game. Starting with a side by side comparison of the two main routines we can see that the demo code survived pretty much intact in Iridis Alpha.

```

Listing 10.4: ... and Iridis Alpha.

To start getting a handle on how the oscillation animation works, lets plot the first 24 animations that the Torus demo uses when left to its own devices. We get a variety of different trajectories, some relatively simple, some quite convoluted.

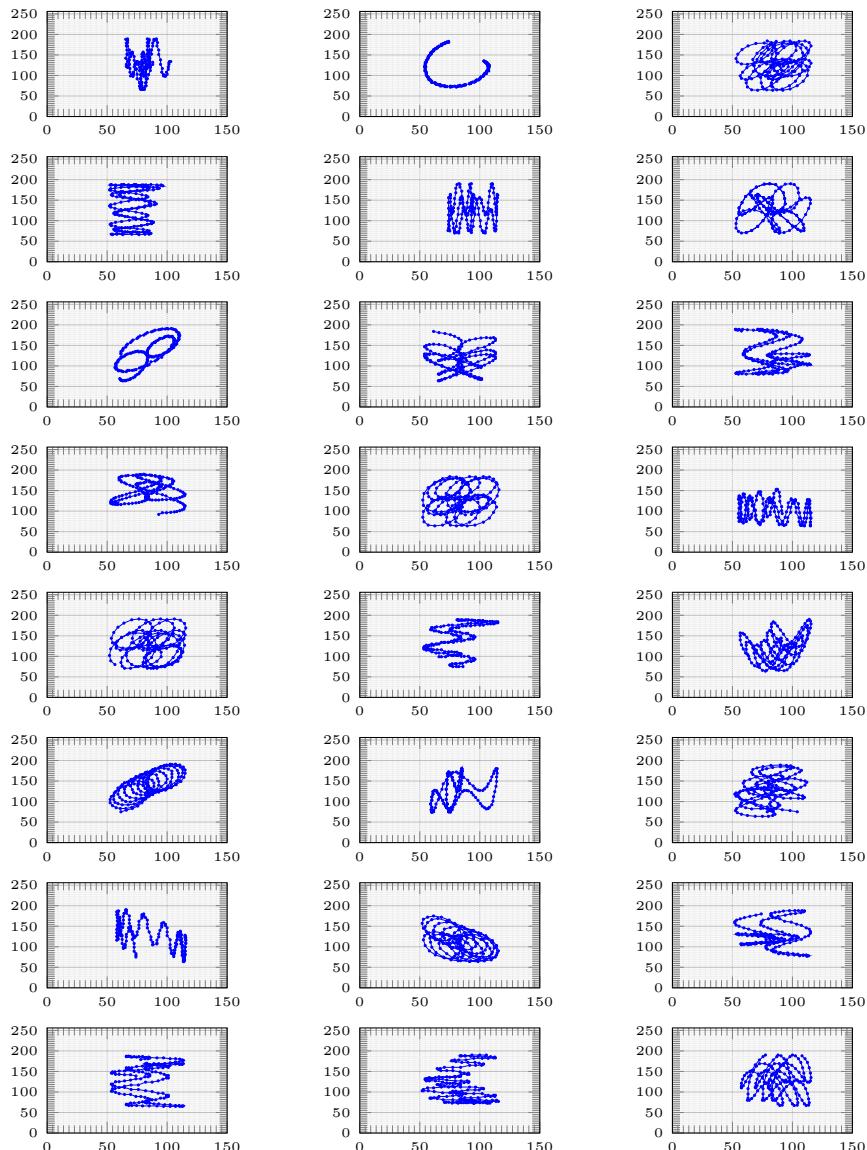

Figure 10.8: The first 24 oscillation patterns generated by the Torus demo.

When we look into the code we find this petting zoo of animations is principally driven by a simple sequence of bytes stored in `spritePositionArray`.

```
spritePositionArray    .BYTE $40,$46,$4C,$52,$58,$5E,$63,$68
                     .BYTE $6D,$71,$75,$78,$7B,$7D,$7E,$7F
                     .BYTE $80,$7F,$7E,$7D,$7B,$78,$75,$71
                     .BYTE $6D,$68,$63,$5E,$58,$52,$4C,$46
                     .BYTE $40,$39,$33,$2D,$27,$21,$1C,$17
                     .BYTE $12,$0E,$0A,$07,$04,$02,$01,$00
                     .BYTE $00,$00,$01,$02,$04,$07,$0A,$0E
                     .BYTE $12,$17,$1C,$21,$27,$2D,$33,$39
                     .BYTE $FF
```

We can get a sense of how this rising and falling sequence of values can be used to plot a course across the screen if we treat each as an x and y value on a graph of cartesian co-ordinates. In the twenty four instances below we start by treating the value as providing both the x and y position. In each subsequent one we skip an increasing number of positions ahead in the sequence to get the y value, producing a variety of elliptical orbits around the screen.

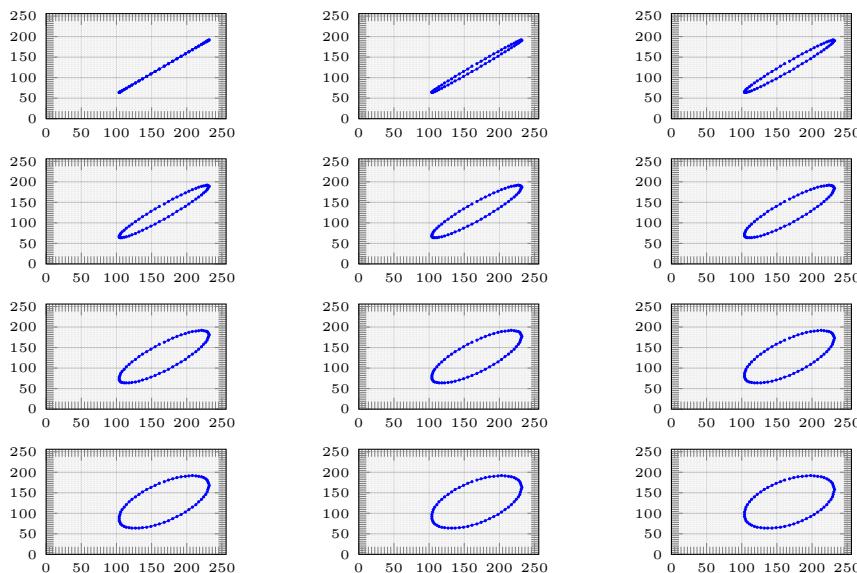

Figure 10.9: Using the x/y offset in `spritePositionArray` where y is the value after x in the array.

To get beyond simple ellipsoids we need to do more than pick a different value in the array for our x and y offsets. Here we experiment with something a little more involved. We update the x and y positions at different intervals and when skipping ahead

in `spritePositionArray` for a new value for x and y we use a pre-selected, random number of bytes to skip past.

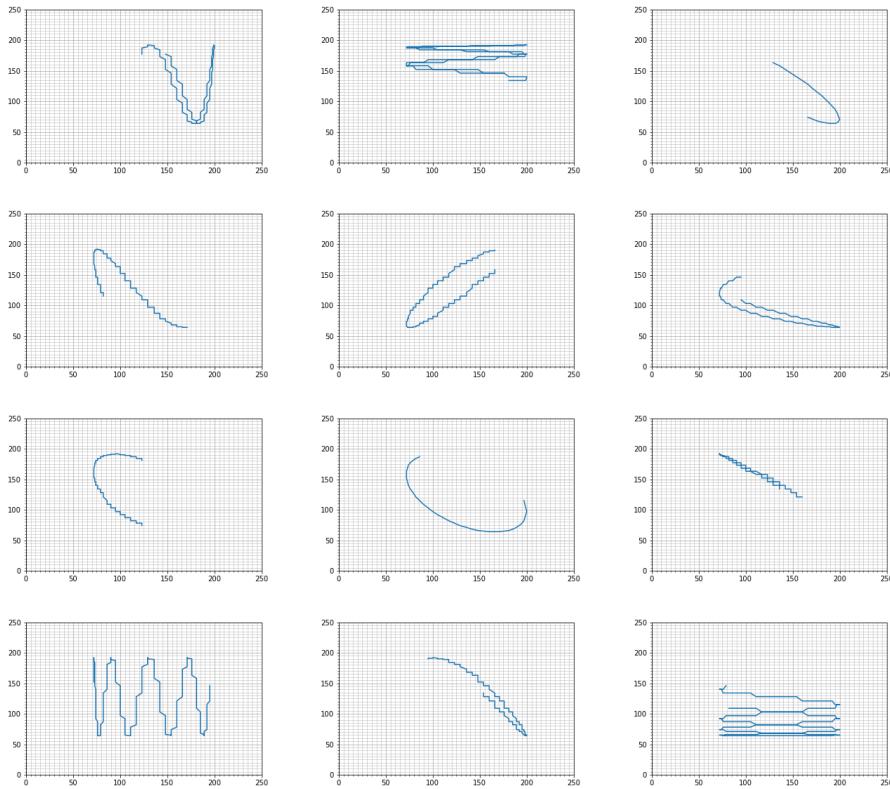

Figure 10.10: Testing different values of x and y

This is starting to look more like the actual results we observed and it is where the 4 values selectable by the player using keys z, x, c, and v in the Torus demo come in. In addition to controlling the music generation procedure, as we've already seen, they also determine the way the values in `spritePositionArray` are selected for position the sprite in each new frame. This is based on letting them determine the frequency with which the position of the x and y values of each sprite is changed and how far to skip ahead in `spritePositionArray` when selecting a new value from it for the x and y position.

Key	Name	Purpose	Code
Z	Oscillator 1	- Intervals between updating X position. - The amount to increment the index into spritePositionArray when getting the next X position.	<pre> MaybeZKeyPressed CMP #\$0C BNE MaybeXKeyPressed ; Update Oscillator 1 LDA oscillator1Value CLC ADC #\$01 AND #\$0F STA oscillator1Value TAX LDA intervalBetweenPosUpdatesArray,X STA initialCounterBetweenXPosUpdates LDA positionIncrementArray,X STA incrementForXPos JMP ContinueCheckingForKeyPress </pre>

V	Oscillator 4	- How often to increase the index that seeks ahead to get a value from spritePositionArray for adding to the next Y position.	<pre> MaybeVKeyPressed CMP #\$1F BNE MaybeFIDPressed ; Update Oscillator 4 LDA oscillator4Value CLC ADC #\$01 AND #\$0F STA oscillator4Value </pre>

Figure 10.11: The purpose of each of the oscillator values.

In RunMainInterruptHandler we can see how each of these values set by the player is used to maintain an accounting of the different sprite positions for each of the 8 sprites:

```

RunMainInterruptHandler
    LDY #$00
    LDA #$F0
    STA $D012      ; Raster Position
    DEC counterBetweenXPosUpdates
    BNE MaybeUpdateYPos

    UpdateXPos
        LDA initialCounterBetweenXPosUpdates
        STA counterBetweenXPosUpdates

        LDA incrementForXPos

```

```
CLC
ADC indexForXPosInSpritePositionArray
STA indexForXPosInSpritePositionArray

MaybeUpdateYPos
DEC counterBetweenYPosUpdates
BNE MaybeUpdateXPosOffset

LDA initialCounterBetweenYPosUpdates
STA counterBetweenYPosUpdates

LDA indexForYPosInSpritePositionArray

BNE MaybeUpdateYPosOffset

LDA oscillator3Value
STA cyclesBetweenXPosOffsetUpdates
INC indexForXPosOffsetInSpritePositionArray

MaybeUpdateYPosOffset
DEC cyclesBetweenYPosOffsetUpdates
BNE StoreInitialIndexValues

LDA oscillator4Value
STA cyclesBetweenYPosOffsetUpdates
INC indexForYPosOffsetInSpritePositionArray
```

Before animating each of the 8 sprites we use the values set by the player to prepare the variables that will be applied to positioning each sprite. For example the value selected with the Z key has been used to set `initialCounterBetweenXPosUpdates` and `incrementForXPos`. In the first lines above in `UpdateXPos` we use them to set up `indexForXPosInSpritePositionArray`. This is then used in `SpriteAnimationLoop` to select the X position of the current sprite:

```
SpriteAnimationLoop
LDA indexForXPosInSpritePositionArray
AND #$3F
TAX
LDA spritePositionArray,X
STA currSpriteXPos
```

You can follow the same lineage between the setting of each value in our table above with the rest of the `SpriteAnimationLoop` routine.

A Testing Hack

It's not easy to create a bonus animation and test it unless you plan to play through the game each time until you earn a bonus. For that reason it makes sense to have some way of calling up the bonus routine quick-and-dirty-like. In the CheckKeyboardInGame routine, we find the following:

```
; We can award ourselves a bonus bounty by
; pressing Y at any time, as long as '1C' is the
; first character in the hi-score table. Not sure
; what this hack is for, testing?
CheckYPressed
    CMP #KEY_Y ; Y Pressed
    BNE ReturnFromKeyboardCheck
    LDA canAwardBonus
    CMP #$1C
    BNE ReturnFromKeyboardCheck
    INC bonusAwarded
    RTS
```

In the above the 'canAwardBonus' byte is the first letter in the name of the player with the top score in the Hi-Score table. By default this is 'YAK':

```
; -----
; The high score table.
; -----
hiScoreTablePtr      .TEXT "0068000"
canAwardBonus        .TEXT "YAK"
                    .FILL 10, $00
                    .TEXT "0065535RATT"
                    .FILL 10, $00
```

But if we change 'Y' to \$1C like so, we can activate the hack:

```
hiScoreTablePtr      .TEXT "0068000"
canAwardBonus        .TEXT $1C, "AK "
```

Note that \$1C is charset code for a bull's head symbol in Iridis Alpha, so it is also possible to enter this as the initial of a high scorer name if we get a score that puts us to the top of the table:

```
.BYTE $66,$C3,$7E,$5A,$7E,$7E,$3C,$00  ;.BYTE $66,$C3,$7E,$5A,$7E,$7E,$3C,$00
; CHARACTER $1c
; 01100110  **  **
; 11000011  **  **
; 01111110  *****
; 01011010  * *** *
; 01111110  *****
; 01111110  *****
; 00111100  ****
; 00000000
```

I'm guessing this was used for testing the animation routine and left in as an Easter egg.

10.3 Taurus/Torus Two

Figure 10.12: Now even freakier you say.

In this second iteration of the Taurus:Torus demo, the theme tune for the main game has crystallized. The routines are now sufficiently identical that they produce the same output. The initial settings produced the Iridis Alpha theme tune as it was in the game's final release.

Listing 10.5: The music routine in Taurus:Torus II side-by-side with Iridis Alpha.

CHAPTER 10. ANOTHER 16^4 TUNES

Procedurally Generated

Taurus/Torus Two Tune

(Sid.)
Jeff Minter

1 of 100,000,000,000,000

The musical score for Taurus/Torus Two Tune is a 3x4 grid of staves, each representing a voice. The top row contains three staves labeled 'Voice 1', 'Voice 2', and 'Voice 3'. The bottom row contains three staves, also labeled 'Voice 1', 'Voice 2', and 'Voice 3'. The music is in 12/8 time, G major, and consists of eighth-note patterns. The notes are primarily eighth notes, with some sixteenth-note patterns. The score is titled 'Taurus/Torus Two Tune' and is identified as '1 of 100,000,000,000,000'.

Figure 10.13: The music produced by Taurus/Torus Two. This is note for note identical to the theme tune in the final game below.

Procedurally Generated

Iridis Alpha Title Theme

(Sid.)
Jeff Minter

1 of 100,000,000,000,000

The musical score for Iridis Alpha Title Theme is a 3x4 grid of staves, each representing a voice. The top row contains three staves labeled 'Voice 1', 'Voice 2', and 'Voice 3'. The bottom row contains three staves, also labeled 'Voice 1', 'Voice 2', and 'Voice 3'. The music is in 12/8 time, G major, and consists of eighth-note patterns. The notes are primarily eighth notes, with some sixteenth-note patterns. The score is titled 'Iridis Alpha Title Theme' and is identified as '1 of 100,000,000,000,000'.

Made in France

Figure 11.1: Splash screen for the version of 'Made in France' released on CompuNet.

I must admit I don't find this pause-mode mini-game of much interest in its own right. I initially wondered if Jeff Minter had inadvertently invented a precursor to 'Snake', a text-based game that was once ubiquitous thanks to its inclusion on Nokia mobile phones in the 1990s, but it turns out that Snake dates back to at least 1976 when the concept first appeared in an arcade game called 'Blockade'.

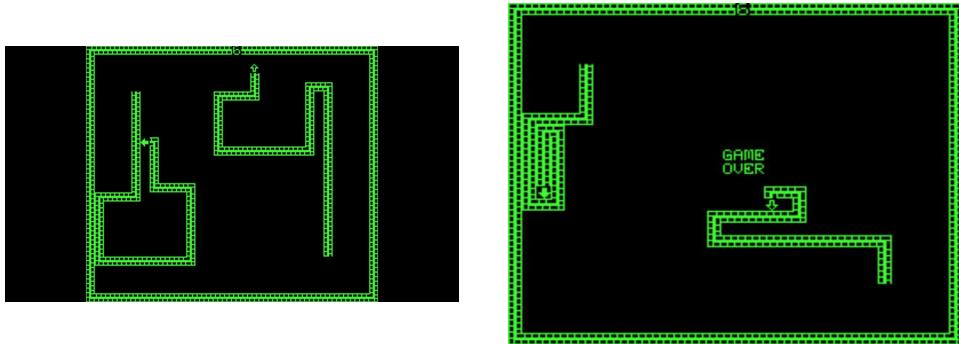

Figure 11.2: 'Blockade' from 1976, a two-player arcade game by Gremlin.

Perhaps the most noteworthy thing about 'Made in France' (MIF) is how many times Minter has made and remade it. His very first attempt at the format was one of his earliest games. 'Deflex' was coded in 1979 while he was in Queen Mary's Sixth Form college in Basingstoke and had access to a Commodore PET. Viewed side by side it's obvious that one is a slightly more colorful remake of the other.

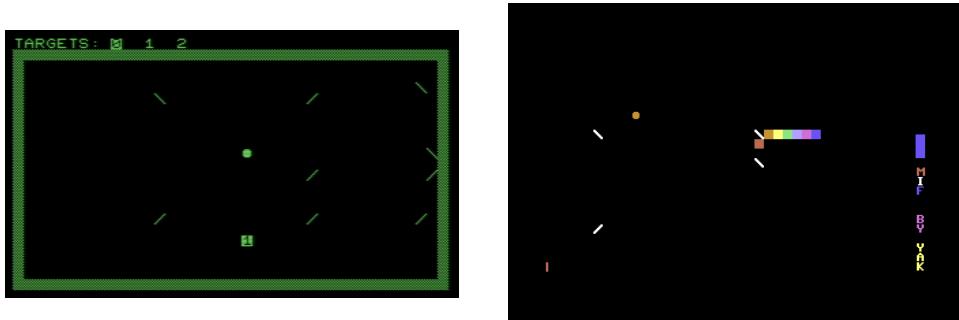

Figure 11.3: 'Deflex' on the left, 'Made in France' on the right. The original Commodore PET version of 'Deflex' is lost, so in 2023 [Jeff Minter remade it!](#)

'Made in France' (or MIF for short) was coded while on a winter holiday in France during the making of Iridis Alpha. Minter lugged his development kit to a ski resort in the Alps and continued work between time on the slopes. Over a couple of spare evenings he remade Deflex into MIF. He shared this version on Compunet prior to the release of Iridis Alpha and the version that features in the game is unchanged from that original version.

The gameplay of Deflex and MIF has only a couple of differences. In MIF the player is on a timer and dies if they fail to complete the level before it elapses.

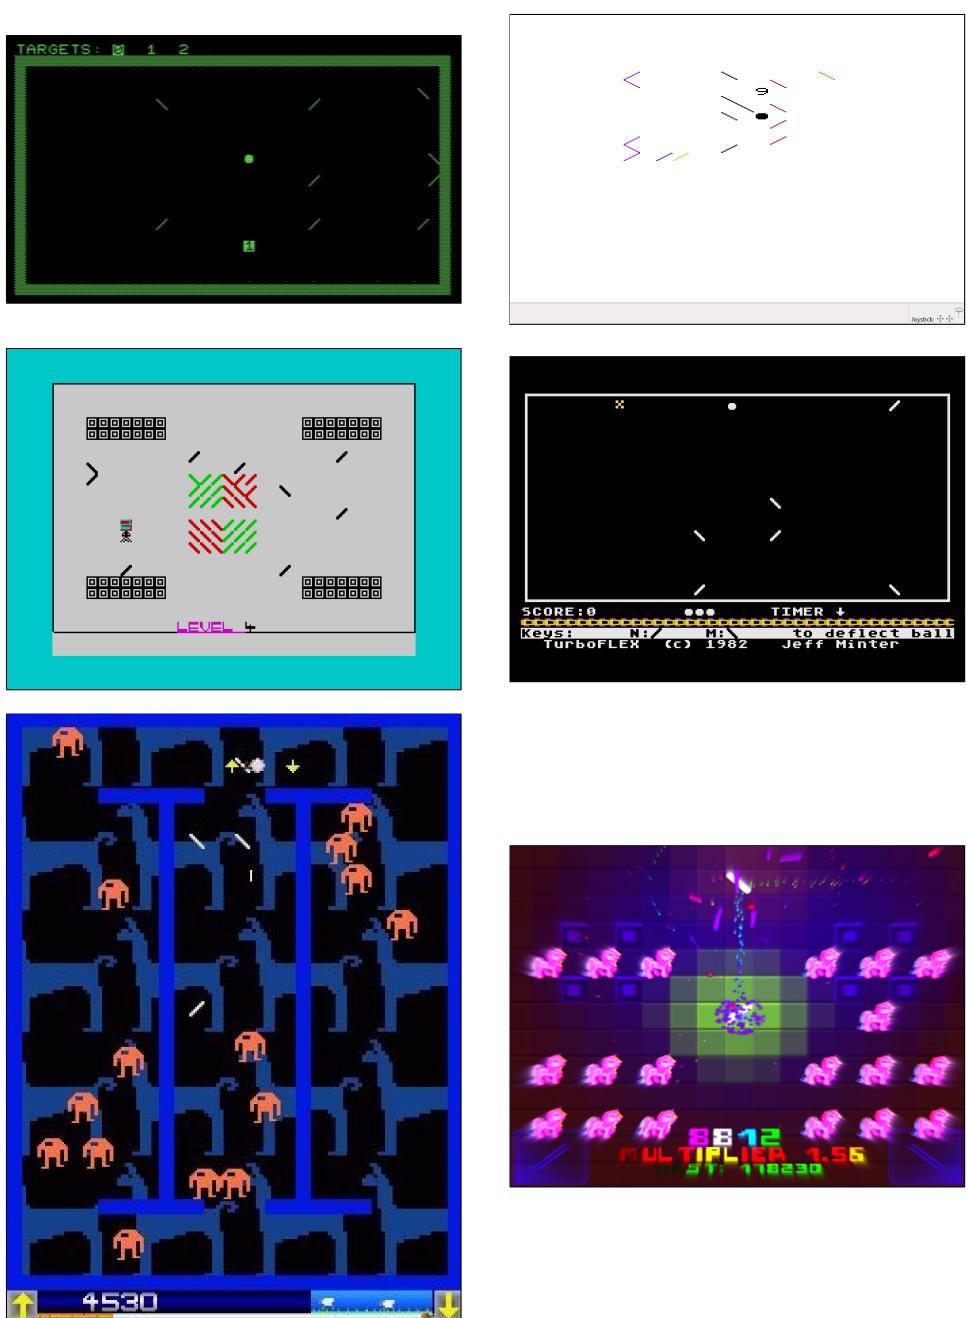

Figure 11.4: Deflex through the ages.

The most striking thing to the modern player is the controls. You place paddles (or deflectors) by using the 'N' and 'M' keys. At first this seems inexplicable: why not use arrow keys instead? The answer lies in the layout of the C64 and Commodore Pet keyboards:

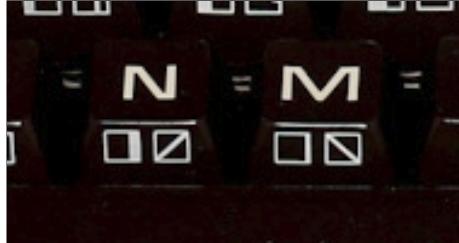

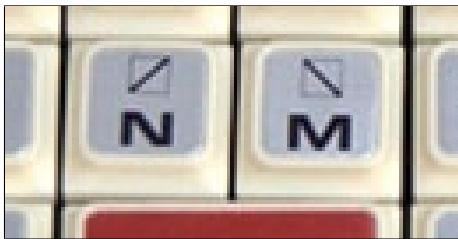

Figure 11.5: The controls seem unintuitive to a player using a C64 emulator. Why use 'M' and 'N' for placing paddles? The answer lies in the PET and C64 keyboard layouts: the 'm' and 'n' keys each bear the paddle glyphs.

11.1 Main Loop

The code for MIF comes in at a relatively light 900 or so lines of 6502 assembler. The main loop of the game is primarily concerned with detecting key presses to enter into the DNA mini-game (see [A Pause Mode for Your Pause Mode](#)) or exit back to Iridis Alpha itself.

```

11.2 A Target Exploses

One point of interest in this mini-game is the explosion when you finally overcome the frustrating controls and manage to strike the target with your snake.

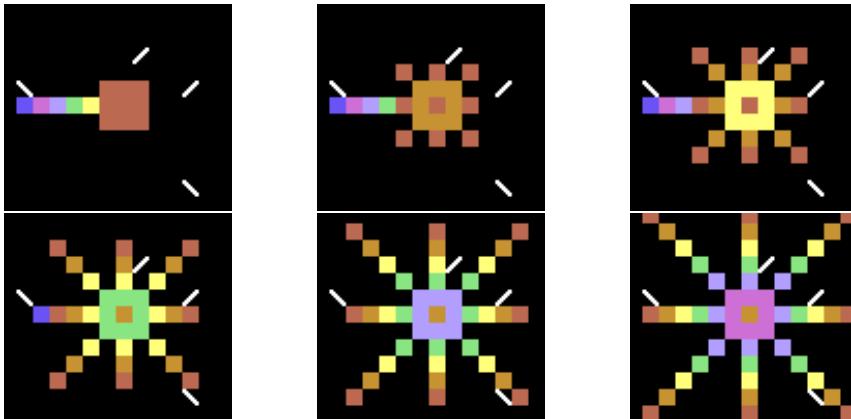

Figure 11.6: Stages in the target's explosion

If we carefully examine the sequence of the explosion above it is possible to discern what is going on. At each step we paint eight red squares. In the first step, these eight squares will enclose our target giving us a solid block.

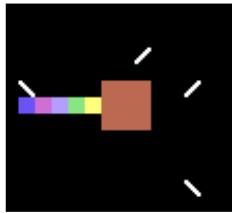

Figure 11.7: Step One

In the following step, we paint eight red squares again but this time we separate each with a single space. We also paint eight squares again like we did in the first step, but this time in the colour brown.

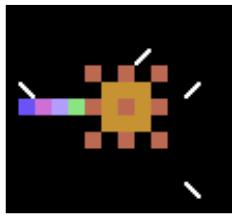

Figure 11.8: Step Two

In the third step, we paint eight red squares again but this time we separate each with two spaces. We also paint eight squares separated by a single space, but this time in the color brown. Finally we paint eight squares separated by no spaces and this time in the colour yellow.

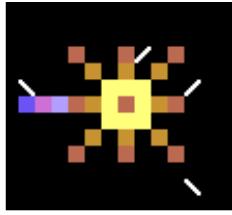

Figure 11.9: Step Three

Are you beginning to get the idea? We do this until we have used up all 8 colours and we keep exploding until we have reached a limit of 48 spaces between squares.

Here is the routine that runs every time the interrupt is called and there's an explosion in progress. It maintains the current outer limit of the explosion in `previousSpacesBetweenSquares` and works inwards each time it is called, painting the layers of the explosion in ever-decreasing circles:

```
DoAnExplosionFrame
    LDA #$A0
    STA mifCurrentChar
    LDA previousSpacesBetweenSquares
    STA spacesBetweenSquares
    LDA #$00
    STA currentColor

        CMP #48 ; Until we have 48 spaces between squares
        BEQ ExplosionFinished
        RTS

ExplosionFinished
        LDA #$00
        STA targetIsExploding
        RTS
    
```

Listing 11.1: The routine responsible for animating a frame of the explosion it will keep getting called until it sets `targetIsExploding` to \$00.

The actual 'painting of squares to the screen' is performed by the `PopulateAStageInTheExplosion` routine given below. Notice that this is what is called an 'unrolled loop'. That is, it would be possible to write this as a loop of some sort but it is in fact simpler and more performant (at the expense of being more verbose) to just write out the painting of all eight squares individually rather than refactor them into an iteration:

```

PopulateAStageInTheExplosion

```

Listing 11.2: The routine responsible for animating a frame of the explosion it will keep getting called until it sets targetIsExploding to \$00.

Notice that painting the eighth square is achieved by simply falling through to `DrawCharacterIfItsStillOnScreen`, whereas for each of the previous seven squares this subroutine is called and returned from.

I also quite like the simple logic at the end of the routine to ensure we don't bother trying to paint characters that are not on the screen. As a whole, this routine leverages nicely the 'return early' pattern where we bail out early if a condition is not met but otherwise let the code proceed to execute to the end and do what needs to be done *only if it needs to be done*.

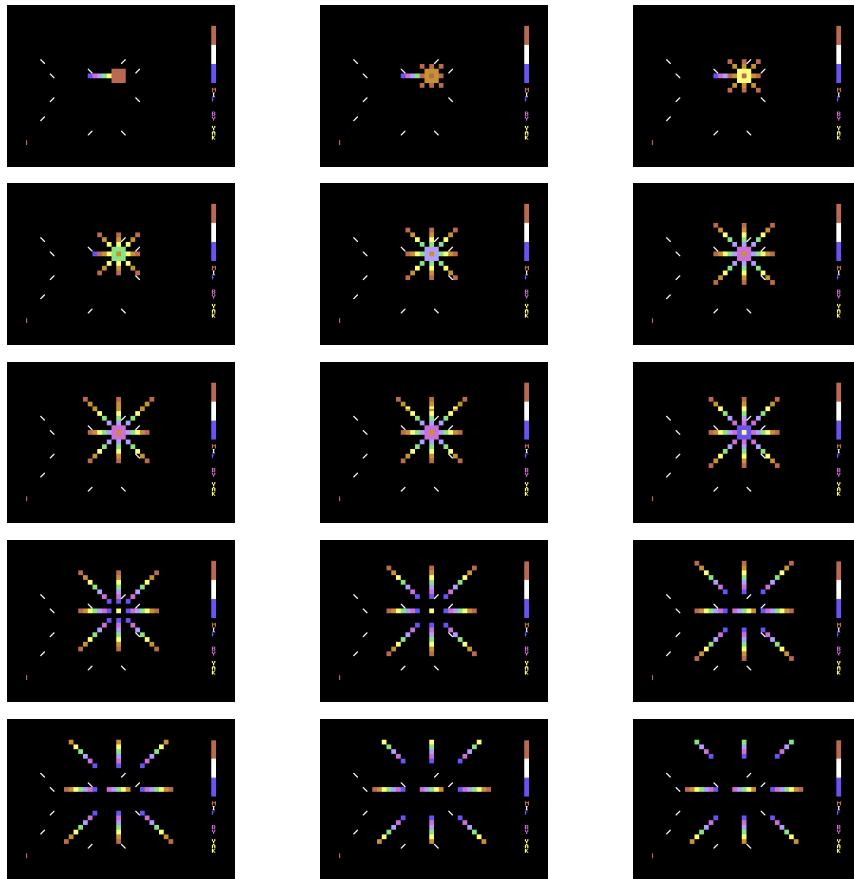

Figure 11.10: A full explosion sequence.

A Pause Mode for your Pause Mode

Any pause mode must surely be in need of a pause mode. Titled 'DNA' this little entertainment is a cousin of Minter's previous work on Psychedelia for the C64 and Colorspace for the Atari 800 in 1984 and 1985. It isn't accessed directly from the game but instead is invoked by pressing the asterisk key while playing 'Made in France'.

Figure 12.1: DNA: A pause mode within a pause mode.

CHAPTER 12. A PAUSE MODE FOR YOUR PAUSE MODE

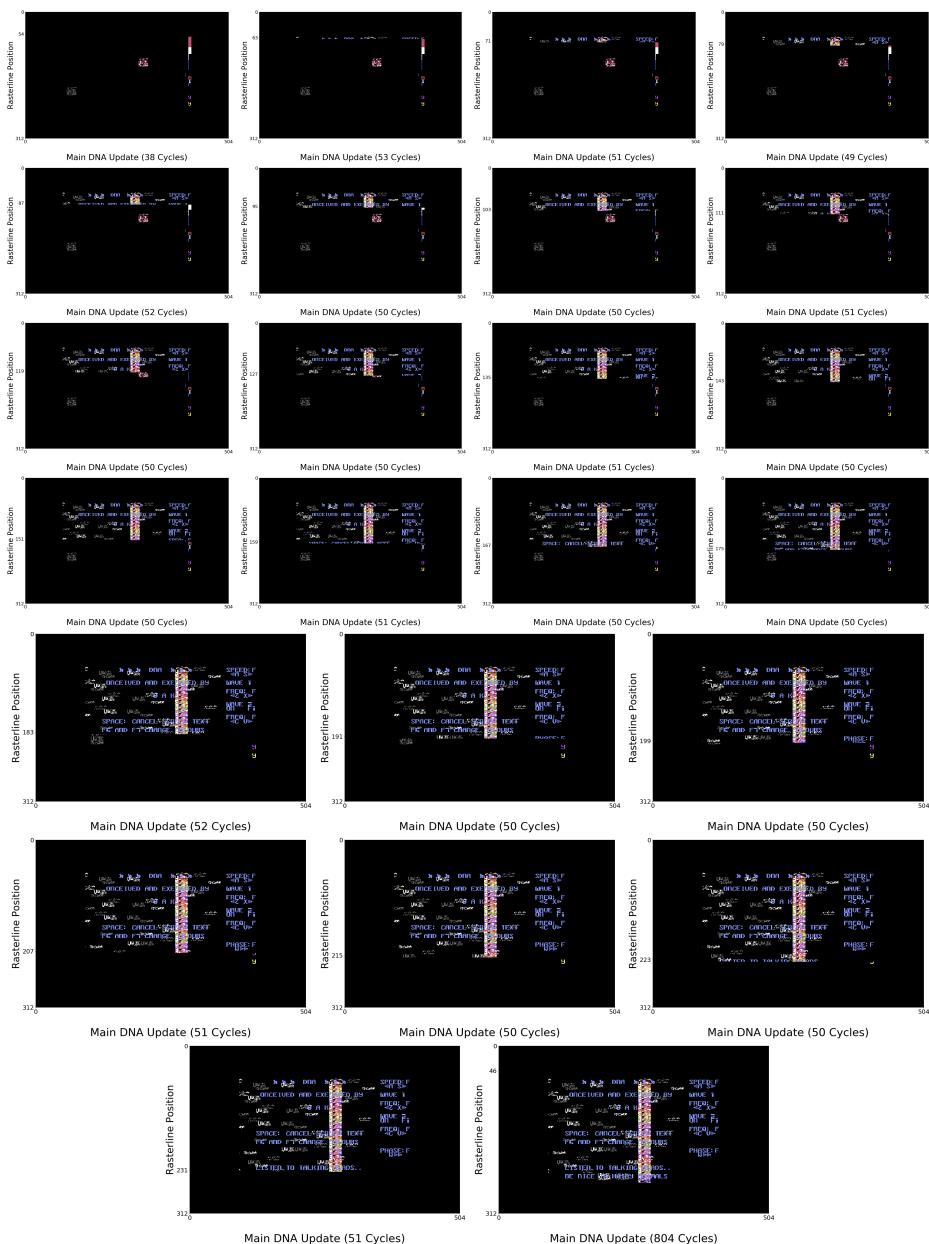

Figure 12.2: The first screen paint in DNA. There are 24 raster interrupts allowing us to paint a long chain of sprites.

```
titleTextLine1    .TEXT "          DNA      "
titleTextLine2    .TEXT " CONCEIVED AND EXECUTED B"
titleTextLine3    .TEXT "Y           Y A K      "
titleTextLine4    .TEXT " SPACE: CANCEL SCREEN TEX"
titleTextLine5    .TEXT "TF5 AND F7 CHANGE COLOURS"
titleTextLine6    .TEXT " LISTEN TO TALKING HEADS."
titleTextLine7    .TEXT ".BE NICE TO HAIRY ANIMALS "
```

Listing 12.1: Defining the text for the DNA screen

Minter first shared it as a tiny 11K demo in a UK CompuNet forum in the summer of 1986. It followed shortly after 'Torus', an oscillator-based demo, shared at the same time and which we covered earlier: both are sprite-based light synthesisers where, like Psychedelia and Colorspace, the player gets to experiment with different configurations that control the behaviour of a frantic assembly of brightly colored, pulsating sprites.

DNA has an unapologetically daft premise: two chains of flashing eyeballs cascade down the screen in an unsettling, blinking helix configuration. Your object as player is to twiddle the available knobs to see if you can get them to do anything interesting while listening to your favorite music.

For its time DNA's most noteworthy feature was the number of sprites being written to the screen. There are 48 eyeballs displayed at any one time, in addition to a pair of parallax starfields drifting past in the background. As you may have gathered by now, the C64 can only support 8 sprites in total so this would have seemed like wizardry to the uninitiated. If you're not dipping into this chapter at random, but have read any of the previous chapters in this book you may already be able to guess the secret to this unsettling feat: raster interrupts.

As elsewhere in Iridis Alpha the trick to filling the screen with sprites is to write a tight piece of code that can run periodically during a single paint of the screen, adding a layer of sprites to each horizontal section. We tell the C64 where we want the raster to interrupt its progress and call our code. This code will then paint as many sprites as possible on the horizontal layer. DNA takes the approach of painting a pair of eyeballs at 8 pixel vertical intervals, so each horizontal layer is 8 pixels tall. These intervals are defined in `dnaSpritesYPositionsArray`:

```
dnaSpritesYPositionsArray      .BYTE $30,$38,$40,$48,$50,$58,$60,$68
                                .BYTE $70,$78,$80,$88,$90,$98,$A0,$A8
                                .BYTE $B0,$B8,$C0,$C8,$D0,$D8,$E0,$E8
                                .BYTE END_SENTINEL
```

While the Y co-ordinates of the sprites are set in stone, their X co-ordinates must be calculated on the fly and indeed the purpose of the twiddling knobs is to control the

way these co-ordinates are generated. Initially the X positions are all set to 192 (\$C0):

```
dnaSpritesXPositionsArray      .BYTE $C0,$C0,$C0,$C0,$C0,$C0,$C0,$C0
                                .BYTE $C0,$C0,$C0,$C0,$C0,$C0,$C0,$C0
                                .BYTE $C0,$C0,$C0,$C0,$C0,$C0,$C0,$C0
                                .BYTE $00,$00,$00,$00,$00,$00,$00,$00
                                .BYTE $00,$00,$00,$00,$00,$00,$00,$00
```

With every full paint of the screen DNA calculates a new X co-ordinate and puts it at the head of the array. Depending on the value given as the 'Speed' setting, it then shifts all the others in the array to the right by one position.

```
DNA_PropagatePreviousXPosToTheRight
    LDX #$27
PropagateToRightLoop
    LDA dnaSpritesXPositionsArray - $01,X
    STA dnaSpritesXPositionsArray,X
    DEX
    BNE PropagateToRightLoop
    RTS
```

This very quickly fills the array. We can see this in operation from the below snippet in DNA_MainAnimationRoutine. In order to calculate the x position for the right hand chain, it shows the value in dnaCurrentPhase being added to the value dnaCurrentSpritesPosArrayIndex to pick out a value in dnaSpritesXPositionsArray offset by the amount of the 'Phase' setting:

```
LDX dnaCurrentSpritesPosArrayIndex
.
; Add in the phase to our index to the X position of the
; sprite on the right hand chain. If the result is greater
; than the number of values in the array ($27) subtract it
; out again.
TXA
.
ADC dnaCurrentPhase
CMP #$27
BMI UpdateXPosWithPhase

; Back out the addition if result greater than $27.
SEC
SBC #$27
UpdateXPosWithPhase
; Finally, use the offset given by the update value
; in 'A', load it to 'X' and use it pick the X
; position from dnaSpritesXPositionsArray.
TAX
LDA dnaSpritesXPositionsArray,X
STA $D004,Y ;Sprite 2 X Pos
```

Listing 12.2: dnaCurrentPhase is set by the 'Q' key.

In essence, the 'Phase' setting acts as an offset into the X Position array picking up

previous values of X Pos from the left hand chain.

In the table below we've selected a few frames from the first second or two showing how the array fills up and how values from the array are selected for the X position of the left and right chains. Notice how the 'Phase' setting of 5 effectively means the right-hand chain lags 5 'eyeballs' behind the left chain in terms of the positions.

State	Left Chain	Right Chain
	<pre> dnaSpritesXPositionsArray .BYTE \$58,\$5A,\$60,\$67,\$71,\$7C,\$89,\$96, .BYTE \$A3,\$AE,\$B6,\$BB,\$BC,\$B9,\$B3,\$A9, .BYTE \$9D,\$8F,\$80,\$C0,\$C0,\$C0,\$C0,\$C0, .BYTE \$C0,\$C0,\$C0,\$C0,\$C0,\$C0,\$C0,\$C0, .BYTE \$C0,\$C0,\$C0,\$C0,\$C0,\$C0,\$C0,\$C0</pre>	<pre> dnaSpritesXPositionsArray .BYTE \$58,\$5A,\$60,\$67,\$71,\$7C,\$89,\$96, .BYTE \$A3,\$AE,\$B6,\$BB,\$BC,\$B9,\$B3,\$A9, .BYTE \$9D,\$8F,\$80,\$C0,\$C0,\$C0,\$C0,\$C0, .BYTE \$C0,\$C0,\$C0,\$C0,\$C0,\$C0,\$C0,\$C0, .BYTE \$C0,\$C0,\$C0,\$C0,\$C0,\$C0,\$C0,\$C0</pre>

Figure 12.3: Examples of the x co-ordinates (highlighted) in dnaSpritesXPositionsArray used by the left and right chain when 'phase' is set to 5.

We said a new value for the top eye-ball in each chain is calculated every paint, but whether the existing values get propagated to the right in dnaSpritesXPositionsArray depends on the 'Speed' setting:

```
UpdateXPosArrays
    DEC actualSpeed
    BNE CalculateNewXPosForHead

    ; The speed setting determines how quickly
    ; the X pos values are propagated down the
    ; chains.
    LDA dnaCurrentSpeed
    STA actualSpeed
    JSR DNA_PropagatePreviousXPosToTheRight
```

Listing 12.3: dnaCurrentSpeed is set by the 'A' and 'S' keys.

The 'Speed' setting is effectively a counter that is decremented at every paint, once it reaches zero it gets reset back to its initial value (in this case '1') and the X Positions are all shifted to the right in dnaSpritesXPositionsArray.

How is the new value for the eyeball at the head of each chain calculated? We get that it's updated at every screen paint but what determines it? The calculation is a two-phase process but both phases depend on the same array of values stored in newXPosOffsetsArray. This is a rattle-bag of X positions describing a more or less continuous curve:

```
newXPosOffsetsArray .BYTE $40,$46,$4C,$53,$58,$5E,$63,$68
                     .BYTE $6D,$71,$75,$78,$7B,$7D,$7E,$7F
                     .BYTE $80,$7F,$7E,$7D,$7B,$78,$75,$71
                     .BYTE $6D,$68,$63,$5E,$58,$52,$4C,$46
                     .BYTE $40,$39,$33,$2D,$27,$21,$1C,$17
                     .BYTE $12,$0E,$0A,$07,$04,$02,$01,$00
                     .BYTE $00,$00,$01,$02,$04,$07,$0A,$0E
                     .BYTE $12,$17,$1C,$21,$27,$2D,$33,$39
                     .BYTE END_SENTINEL
```

Listing 12.4: Notice that the values start at \$40 rise gradually to \$80 back to \$00 and then back up to \$40 again.

The other factors in this calculation are the 'Frequency' selected for each chain, the left-hand chain (Wave 1) and the right-hand chain (Wave 2). The values that do the most work are xPosOffsetForWave1 and xPosOffsetForWave2.

```

DNA_UpdateSettingsBasedOnFrequency
    LDA dnaWave1Frequency
    AND #$1F
    TAX
    LDA timesToNextUpdateForFrequency,X
    STA initialTimeToNextUpdateForWave1
    STA timeToNextUpdateCounterForWave1
    LDA xPosOffsetsForFrequency,X
    STA xPosOffsetForWave1

    LDA dnaWave2Frequency
    AND #$1F
    TAX
    LDA timesToNextUpdateForFrequency,X
    STA initialTimeToNextUpdateForWave2
    STA timeToNextUpdateCounterForWave2
    LDA xPosOffsetsForFrequency,X
    STA xPosOffsetForWave2
    JMP DNA_UpdateDisplayedSettings
; Returns

```

Listing 12.5: The value selected for 'Frequency' for Wave 1 and 2 translates to settings used in calculating the next X position for each chain.

As we can see above these are populated from `xPosOffsetsForFrequency` using the 'Frequency' as an index.

```

...
LDA xPosOffsetsForFrequency,X
STA xPosOffsetForWave1

...
LDA xPosOffsetsForFrequency,X
STA xPosOffsetForWave2

```

In each case the value populated here is added to a value selected from `newXPosOffsetsArray` to give the new X position for the eyeball at the head of the chain. Well, in a way that's only half true. Separate positions are indeed calculated for the left and right chain, but at the end of the day the position calculated for the right-hand chain (Wave 2) is purely notional. It's just used as an initial value that the value calculated for the left-hand chain is layered on to. This allows the two chains to 'interfere' with each other, as though the position of one affects the other - and reduces the chance of the two overlapping too much:

```

UpdateHeadOfWave
; Take the new X Pos value we calculated for Wave 2, add the position
; we calculated for Wave 1 and make that the new position for the
; lead
; sprite at the head of dnaSpritesXPositionsArray.
LDA notionalNewXPosForWave2

Listing 12.8: Calculate the new X Pos value for the head sprites as well as propagate the values in dnaXPosDataHeadArray to the right when required.

They are both maintaining and updating an index into `newXPosOffsetsArray` and using that to come up with a new X position. They both have to deal towards the end of the routine with the need to ensure the index does not exceed \$40 and subtract \$40 from it if it does. The output of `CalculateValueOfNewXPosForWave2` is essentially the value stored in `notionalNewXPosForWave2` and this is what is used as the input above, in conjunction with `newXPosForWave1`, to come up with the final value for the X position for Wave 1. It is this value that gets added to the head of the working array `dnaXPosDataHeadArray` by `DNA_PropagatePreviousXPosToTheRight`.

Iridis Oops!

13.1 The Byte that Broke

The earliest editions of Iridis Alpha contained a crash bug that manifested itself during the bonus phase. One moment, the player was barrelling their ugly vertically-oriented gilby through the game's obstacle course; the next, the game came to an abrupt halt:

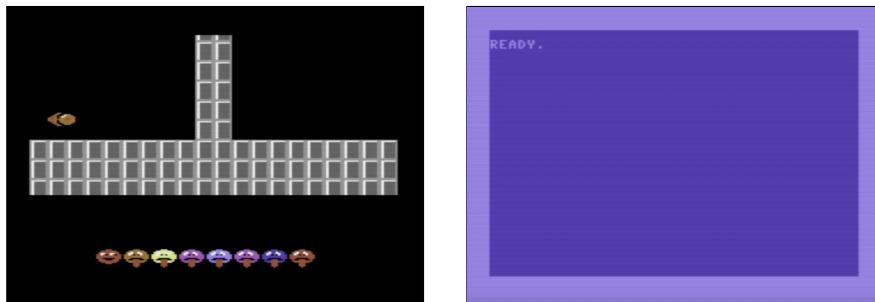

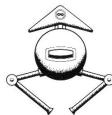

Figure 13.1: You're minding your own business playing this horrible mini-game when it mercifully crashes.

Despite its incredibly rapid pace of development and release this fault was not due to some overlooked glitch in the code of the game.

What happened is that the mastering process had dropped the very last byte in the second section of game data on the tape. You may recall there were four chunks of data encoded on the cassette edition of Iridis Alpha, each containing data to be stored at different points in the C64's memory space.

Jeffrey Breaks the Bad News

"We must apologise to some of the earliest purchasers of Iridis Alpha... it seems that some data was corrupted during the production phase of the data duplication, and the first few hundred copies of the game used to bug out if you lost at the Bonus Phase. All the buggy copies known of have been replaced, and all current tapes are fine, but if you find you have a buggy version you should send it back to those awfully nice Hewsons people and they'll give you an unglitchified one."

The fault lay in a single byte. The very last byte in the second segment on the tape was missing completely. Instead of an \$A2 value, there was nothing. As a result the byte stored in the C64's memory at that position was uninitialized and remained \$00:

Start Address	End Address	Note
0800	BFFE	This one was fine.
BF00	BFFF	The last byte in this section (\$A2) was missing.
C000	CFFE	This one was fine.
E000	F7FF	This one was fine.

Figure 13.2: Chunk BF00 is missing its last byte.

If we look at the data as it should have been we can see the assembly language the machine code would have translated to. The \$A2 is an LDA instruction that loads the value \$07 into the A register:

Address	Bytes	Assembler
\$BFFF	A2 07	LDX #\$07
\$C001	A9 08	LDA #\$08
\$C003	8D F8 BF	STA \$BFFF8

Listing 13.1: The data segment as it should be with \$A2 at \$BFFF

However, because the value at \$BFFF was \$00 instead of \$A2 we end up with this invalid sequence of instructions.

Address	Bytes	Assembler
\$BFFF	00	BRK
\$C000	07 A9	SLO \$A9
\$C002	08	PHP
\$C003	8D F8 BF	STA \$BFFF8

Listing 13.2: The corrupt byte with \$00 at \$BFFF

The first two are probably not fatal, however PHP pushes a value onto the stack. Once the stack is invalid things are going to go south fast. It was probably this instruction,

the last invalid one before the bytes started to make sense again, that sunk this faulty pressing of Iridis Alpha with all hands.

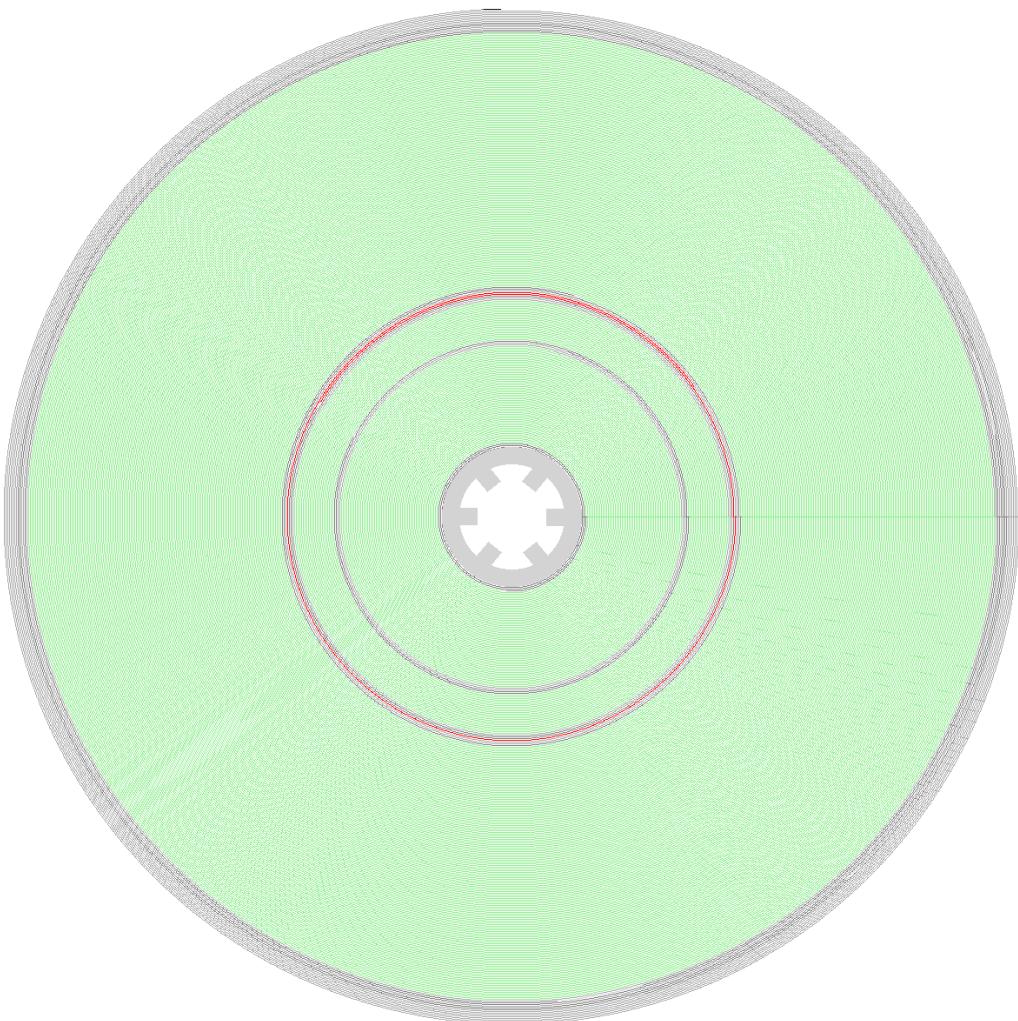

Figure 13.3: The problematic section of data highlighted in red.

13.2 Reappearing Enemies

When you start a new game, enemies from the previous game show up in the first wave. For most people starting out, this will take the form of a few residual 'licker ships' zapping them just as they're getting started.

This bug happens because the 'wave' data isn't cleared down when a new game starts. So whatever is in there from the previous game gets used until they're flushed out by being killed and replaced with the level's proper enemy data.

This isn't a problem when playing the game for the first time after Iridis Alpha is loaded from tape because the first level's data is hardcoded in there. It only becomes apparent when playing the game after your first and subsequent defeats. Since these will usually be at the hands of the infamous licker ships this bug can be particularly painful for the beginner.

The fix is simple enough, we initialize the active wave data stored in 'activeShipsWaveDataLoPtrArray' and 'activeShipsWaveDataHiPtrArray' with the first level's data whenever we start a new game.

```

LDA #$0F
STA $D418      ;Select Filter Mode and Volume
JSR ClearPlanetTextureCharsets
JSR InitializeActiveShipArray ; Added to fix the bug.
JMP PrepareToLaunchIridisAlpha

CPX #$10
BNE InitializeActiveShipLoop
RTS

```

Listing 13.3: Fixing the reappearing enemy bug

13.3 A Sort of Cheat

After a minute or two in the title screen, the game enters 'Attract Mode' and plays a random level on autopilot for a few seconds. If you press F1 during this play you enter the 'Made in France' pause-mode mini game. If you press F1 again you can now start playing the level 'Attract Mode' had selected at random. This can be a handy way of exploring new planets and levels that your meager playing skills prevent you from reaching legitimately!

This handy little cheat is possible because the 'CheckKeyboardInGame' routine doesn't try to prevent you from entering 'Pause Mode' while Attract Mode is running:

```

CheckKeyboardInGame
    LDA lastKeyPressed
    CMP #$40 ; $40 means no key was pressed
    BNE KeyWasPressed
    LDA #$00
    STA f1WasPressed
ReturnEarlyFromKeyboardCheck
    RTS

KeyWasPressed
    LDY f1WasPressed
    BNE ReturnEarlyFromKeyboardCheck
    LDY attractModeCountdown
    BEQ b787C
    ; If a key is pressed during attract mode, accelerate the
    ; countdown so that it exits it nearly immediately.
    LDY #$02
    STY attractModeCountdown

```

Listing 13.4: A trap door to new worlds in Attract Mode

Appendices

Jeff Minter's Development diary for Iridis Alpha

Jeff Minter wrote a diary-of-the-game for Zzap! magazine describing his experience of getting Iridis Alpha from a basic idea to a finished product. It was published issue 13 (May 1986) to issue 17 (September 1986).

29 January 1986

I suppose if I have to pick a day and say, 'I started the game', I guess this is it. I'm still fresh offa the ST, and some idle tinkering with the new assembler I got for the 128 has resulted in a rather neat starfield routine that I'm gonna have in the game. It has 34 stars and they're all generated using just Sprite 0, which leaves plenty of sprites free and room for some scrolling stuff underneath. Uploaded a demo of it onto Cnet.

30 January 1986

Fixed a bug that was making the interrupts desync if you tried to run the stars backward under stick control and overlayed a scrolling grid just to see what it looked like. OK but grid too regular for high speeds. Don't care, only a demo anyway. Uploaded it to CNET. Think this phase is gonna turn out like Sheep in Space a bit, but faster, much. Opposing planet surfaces in centre of screen, warp between? Main character on planet surface will probably be this lovely goat animation that Mo Warden did. It's ace, it even butts. For planet surface you are the goat — accelerate, and you metamorphose into a spaceship for aerial combat. Accelerate again and you can go really fast over the planet, perhaps auto shields flick on at high speeds? Dunno, I'll see. Never approach a

game with too much preconceived ideas, I reckon – let it flow, change, metamorphose. Oh yeah, I'm probably gonna call this game Iridis Alpha and it'll blast like crazy.

1 February to 14 February 1986

(Tied up with proceedings to the launch of Colourspace on the ST, which took place on the 10th Feb at the Laserium, so I didn't hack any serious Commodore code during this time. I needed to practise).

Figure A.1: An early version of the Sheep planet.

15 February 1986

The design is taking more concrete shape in my head. I am altering the scroll routine to fit in with my new plans and splitting the screen in the middle. Got the contraflow routines going over garbage data just to see if they work. It seems that they do although there seems to be a slight glitch at high forward accelerations that I'll look into later.

16 February 1986

Spent the day designing some planet data and graphics, and stuffed it in to see what the routine looks like with some real data. Looked OK but a bit coarse going at 2 pixels/frametime minimum increment, so I rewrote the stars and planet scroll so that the minimum increment is 1 pixel per frame time. It looks a lot better like that. The planet graphics I did are too coarse, though... I don't really like the way they look, so I may

well do a new set tomorrow. The current set is based around a block of data 2 chars x 2 chars, and doesn't look that great.

Did write this really neat routine, though. A complete set of planet graphics takes up 512 bytes of character set data, so I just store the definitions for the top planet and let the computer generate the inverted/reflected set for the bottom planet. Works fine after a little hassle – reflecting multicolour data is a little awkward – but saves storing all those inverted definitions.

17 February 1986

Redid the graphics completely, came up with some really nice looking metallic planet structures that I'll probably stick with. Started to write the GenPlan routine that'll generate random planets at will. Good to have a C64 that can generate planets in its spare time. Wrote pulsation routines for the colours; looks well good with some of the planet structures. The metallic look seems to be 'in' at the moment so this first planet will go down well. There will be five planet surface types in all, I reckon, probably do one with grass and sea a bit like 'Sheep in Space', cos I did like that one. It'll be nice to have completely different planet surfaces in top and bottom of the screen. The neat thing is that all the surfaces have the same basic structures, all I do is fit different graphics around each one. Got to sort out the scroll limits tomorrow... at the moment you can shoot right off the end of the planet into garbage data which ain't too cool. Down the clocktower in the evening, cheap beer, 50p a pint, Courage Best promotion. Well good.

18 February 1986

Fixed scroll limits and did a little more work on the planet generator routine. Scroll looks really neat, especially at high speed. Very pleasing. Must think about doing the ship controls now.

19 February 1986

Wrote the code to put Our Hero (tentatively called B-D) (after the little Indian cigarettes I like) on the planet surface, in the right place, and the right colour, and the right size. Wrote the animation routines that'll be used to make him move. Hooked him up to the scroller so that now he walks left and right under joystick command. Started work on Dark Side set for Colourspace.

20 February 1986

Put in gravity routines for the robot – he can now run and jump, too. The grav is nice and low, graceful leaps. Robot will have to jump over features on the planet surface.

Figure A.2: An early version of the Mushroom planet.

21 February 1986

Ship main control mode now complete, with the addition of the 'spaceship' mode: stop the little robot, jump him up and push the stick left and right to make him transform into a spaceship which can really belt over the planet surface. Control feels good, and I'm pleased, cos that's important.

22-23 February 1986

Weekend in Cardiff with some mates and Colourspace. Dark Side set finished and demonstrated. Was in a car crash. Left my scarf in Cardiff. Freaked people out on train on way home.

24 February 1986

Sprite plex routines written today to reproduce sprites 1-7 on both planets. Works OK. Put in the other 'upside-down' ship controls, work fine but need upside-down sprites defining! At the moment it isn't inverted, uses the same Images as the top one.

25 February 1986

Defined the necessary inverted sprites and banged 'em in. They look fine, the mirrored screen and planets scrolling different directions are really bad for the eyes! Tidied up the joystick control to make it less finicky.

26 February 1986

Seminar on MSX-2 at Microsoft in Reading. Bit of a booze-up, too smashed to do anything constructive in the afternoon.

27 February 1986

Put in planet surface firing for the top ship. The ship lobs out large round bullets while it is on the planet surface – I intend to have certain nasties that can only be properly killed with ground-based fire. The routine works but I am losing every other frame due to interrupt overrun, so I reduce the number of stars on screen to get back about an inch of interrupt time. This does the trick, all cool. Some faffing around with interrupt positioning needed too.

28 February 1986

Finished off firing routines of upper ship, added the faster, horizontal fire that the ship produces while flying above the planet surfaces. The whole thing feels nice, good firing response, just the right spacing between the bullets, and a nice transition from ground/airborne firing modes.

1-2 March 1986

Bone idle.

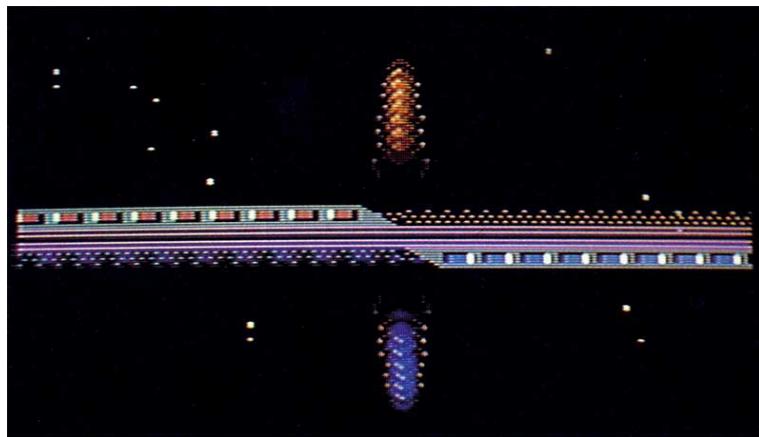

Figure A.3: An early version of the Mushroom planet.

3 March 1986

Wrote the extra bullet-handlers to add fire to the lower ship as well as the upper. The lower ship has its own, independent bullets, they can't just be reflections of the upper ship's bullets. The firing is ace. Love it. Especially the gravity on the planet-bound firing, but then I always did go for gravity.

4-5 March 1986

Much messing around with graphics for the other planet surfaces, got four defined so far, Metallic, Brick, Country and Mushroom (although I have only half finished the graphics on Mushroom). The afternoon went learning how to set up the new telly I've just bought for doing Colourspace on.

6 March 1986

In London, setting up for the ATARI show.

7-9 March 1986

Also in London, getting very knackered doing the Atari show. Continuous lightshows, on the hour, every hour, for three days. Went to Laserium Sat nite, crashed on mate's

floor, failed TOTALLY to get any sleep. Wrecked by Sunday.

10 March 1986

Drove to Ludlow for the second stage of the ZZAP! Challenge. Played games all day, boozier in the evening, crashed the night on La Penn's floor. Ceremoniously burnt the review of Mama Llama with Penn's own lighter. (Next morning Gary Liddon woke to find himself covered in the ashes –Ed)

11 March 1986

Got up, read The Beano went to ZZAP! offices to hassle them for a cup of tea but they ran out of tea bags so had to go to restaurant down the road. Drove back from Ludlow. Lots of sheep near Ludlow, you know. Pretty Welsh ones. Set up 8 foot Colourspace screen in Llab. Had mega session on it.

12 March 1986

Getting stuff ready for taking to France. Will take 128. Probably won't have much chance to work on Iridis Alpha until I get there, now. Another session on the big Space rig tonight with some Clocktower regulars.

Tue 18 March 1986 – in France

Settled in here now. Found an ace black run today, you can go for a whole side of Genesis down it without stopping, but on the second time down I hit a tree stump protruding through the snow, and did an un intentional flying-Yak bit, and landed on a part of my anatomy I'd rather not have landed on. Fired up the 128, finished the Mushroom planet and designed one more, then did a nice fade between planets routine.

Wed 19 March 1986

Cloudy weather – makes skiing hard coz you can't see the bumps. Wrote sonix driver and started to phase in some of the FX for walking, jumping etc.

Thur 20 March 1986

Still cloudy. Some snow. Had to buy crappy, French headphones to replace my excellent Sony pair that I knackered when I got them tangled up in a chairlift, dammit! Extended the sonix driver and did a few more FX. Sonix take ages, lots of messing around to do before you get it just right.

Fri 21 March 1986

Piste all day, back for more SFX, had to rearrange the interrupt sequence to get it all to fit in the frametime.

Sat 22 March 1986

Excellent day – bright sun, good snow, didn't start work till late coz I went on skiing so long. Wrote module to link 8 sprites reserved for 'enemy ships' to planetary motion, and also give them each independent velocities. Did a little work on the Pause mode when I got back from the bar.

Sun 23 March 1986

Really bad weather, horrible snow that's nearer rain and so sticky you need to be standing on a near-vertical incline before you even start moving. Hit the bar early, then back for mega Guardian session, then a little more work on the pause mode.

Mon 24 March 1986

REALLY crappy weather. Got soaked skiing, thawed out in the bar. Retired to room to think about the alien control system while listening to 'The Wall'. Planned it out on paper ready to code later. Got a neat idea for Phase II of the game, thinking along the lines of Batalyx Subgame 1 crossed with a sort of overhead view vertically-scrolling Marble Madness track. Finished off the Pause mode after evening bar. (This'll be the only Pause mode that's been written TOTALLY under the influence of very expensive Guinness).

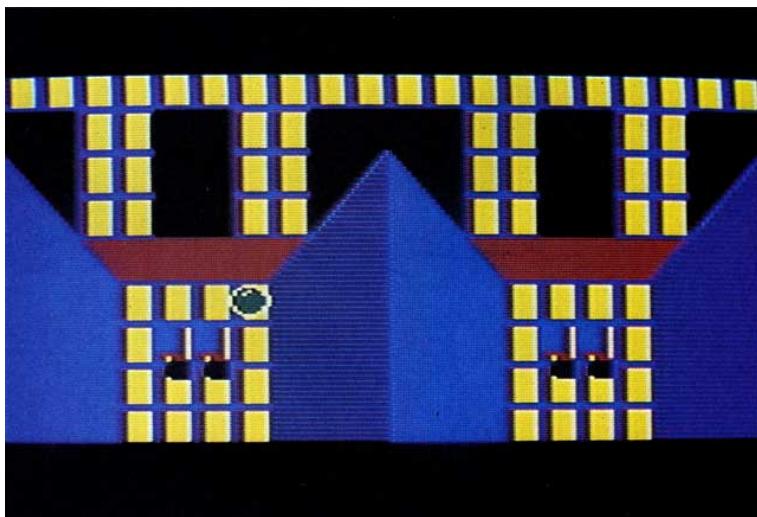

Figure A.4: An early version of the Bonus Phase.

Tue 25 March 1986

New snow, much better skiing all round. Linked completed Pause mode to rest of game. Started on alien control system. Went down bar and got absolutely smashed and had amazing discussion on Life, the Universe and Everything. Listened to 'Wish You Were Here' at half-3, in the morning... ace!

Wed 26 March 1986

Skiing OK, came back after full day's pistebashing to do some AC System hacking. Hit a terrible awful bug, ran through the code a million times but not got it yet, so down bar to drown sorrows in copious amounts of Guinness.

Thu 27 March 1986

Skiing all day then back for the last day's coding in France, I go home tomorrow. Wrestled with the same bug for three hours, was despairing, then noticed a single missing comma in a massive data table that the assembler had neglected, in its infinite wisdom, to flag as an error during assembly, choosing instead to trash the whole data table. Inserted comma; end of bug. Guinness.

Fri 28/Sat 29 March 1986

Trains, trains, trains and Frenchmen, ferry, more train, London, underground, train, bus, Tadley, tea, crash.

Sun 30/Mon 31 March

Lazy. Didn't do anything, couldn't because me 128 is in France and I need to buy another one, and it's Easter holidays.

Tue 1 April 1986

Went into Reading to get a 128D, got it, intended to return and dutifully do some work, but instead met some of the Incentive mob, went to pub (fatal mistake for programmers), all ended back in Tadley for mega-Colourspace session, so fat chance of getting any work done there...

Wed 2 April 1986

Set up new 128D, machine is fine but has a noisy fan and sounds like a small but enthusiastic Hoover. Did a little more work on the ACM, not much mind you.

Thu 3 April 1986

Went up to London to see Ariola mob and copped some Amiga stuff off them – EA stuff but not Marble Madness yet – they seem quite keen on Iridis Alpha, especially my ideas for phase 2.

Figure A.5: Screenshot of Demo Ship Control.

Fri 4 April 1986

Decided for a break to do a little work on Phase 2 and give Phase 1 a rest. Started at 11 am, finished at 7 am next morning, with a LOT of work done.

Sat 5 April 1986

Lots more work done today, I now have a tidy little demo of Phase 2, including complete control system and scrolling background in four different colourschemes, and all inertia routines working. Not bad for a couple days' hacking – got to bed early tonite, 6am!

Sun 6 April 1986

Started to get a little sidetracked now, coz I have to get my newsletter done before I go to Lanzarote on Thursday. HAD A MEGA COLOURSPACE SESSION that finished about half-3 then up writing newsletter till 6. One day maybe I get some sleep.

Mon 7 April 1986

Did a little more tweaking to phase 2, removing the odd bug I'd found. Then finished newsletter overnight.

Tue 8 April 1986

All day working on lightshow for performance at Clocktower this evening. Went good. Got big cheer for 'Stairway to Heaven', and free beer all night.

Wed 9 April 1986

Preparing to go away tomorrow. It's a hard life having to keep trekking around to the snow and the beaches, you never seem to get a decent stretch of work done... (hehehe)

Thu 10/Thu 17 April 1986

Sun, sea, sand and CAMELS.

Fri 18 April 1986

Prepared demos to send off to ZZAP! Couldn't get much serious done because I have to cart all my gear up to London tomorrow for CES Show at Olympia, goes on till Thursday! Then, thank goodness, I get a clear run till the Commodore show, I will at last be able to settle down to some decent coding. Holidays and shows are fine but tend to disrupt you something chronic!!!

Too Much

I've decided to drop the individual daily notes for this particular section. I looked at it and there was just too much stuff that was the same on consecutive days, y'know, stuff like May 3: Worked on ACONT. May 4: More work on ACONT. May 5: did stuff for ACONT, etc... etc... What I'll do is try and tell you exactly what's been developed within the game and why it's there.

ACONT

This is the bit that I knew would take me ages to write and get glitch free, and the bit that is absolutely necessary to the functioning of the game. The module ACONT is essentially an interpreter for my own 'wave language', allowing me to describe, exactly, an attack wave in about 50 bytes of data. The waves for the first part of IRIDIS are in good rollicking shoot-'em-up style, and there have to be plenty of them. There are five planets and each planet is to have twenty levels associated with it. It's impractical to write separate bits of code for each wave; even with 64K you can run outta memory pretty fast that way, and it's not really necessary coz a lot of stuff would be duplicated. Hence ACONT.

You pass the interpreter data, that describes exactly stuff like: what each alien looks like, how many frames of animation it uses, speed of that animation, colour, velocities in X- and Y- directions, accelerations in X and Y, whether the alien should 'home in' on a target, and if so, what to home in on; whether an alien is subject to gravity, and if so, how strong is the gravity; what the alien should do if it hits top of screen, the ground, one of your bullets, or you; whether the alien can fire bullets, and if so, how frequently, and what types; how many points you get if you shoot it, and how much damage it does if it hits you; and a whole bunch more stuff like that. As you can imagine it was a fairly heavy routine to write and get debugged, but that's done now; took me about three weeks in all I'd say.

GENESYS

With ACONT running I had to implement the GENESYS routine, which actually oversees passing data to ACONT, finding out what aliens to unleash depending on what wave we're on and what planet, arranging for shot aliens to be cleaned up and new ones sent out to replace them. I had ACONT running with a limited, one-wave only version of GENESYS at the Commodore show, where a demo of IRIDIS was running non-stop on our stand. I stayed up till three, the morning of the show, preparing a neato title screen with one of my sprite starfields, the game's title and an animated demo, but hardly anyone saw the demo anyway coz they were all playing the game.

I was surprised at the response, after all the thing was only a demo, the scoring was erratic, there was only one wave and you couldn't get killed, but still it was heavily played at the show. People seemed to get into it, enjoying the raw blasting of the thing. One lad even begged to buy my development demo off me, he was just getting off on the blasting and wanted to carry on at home!

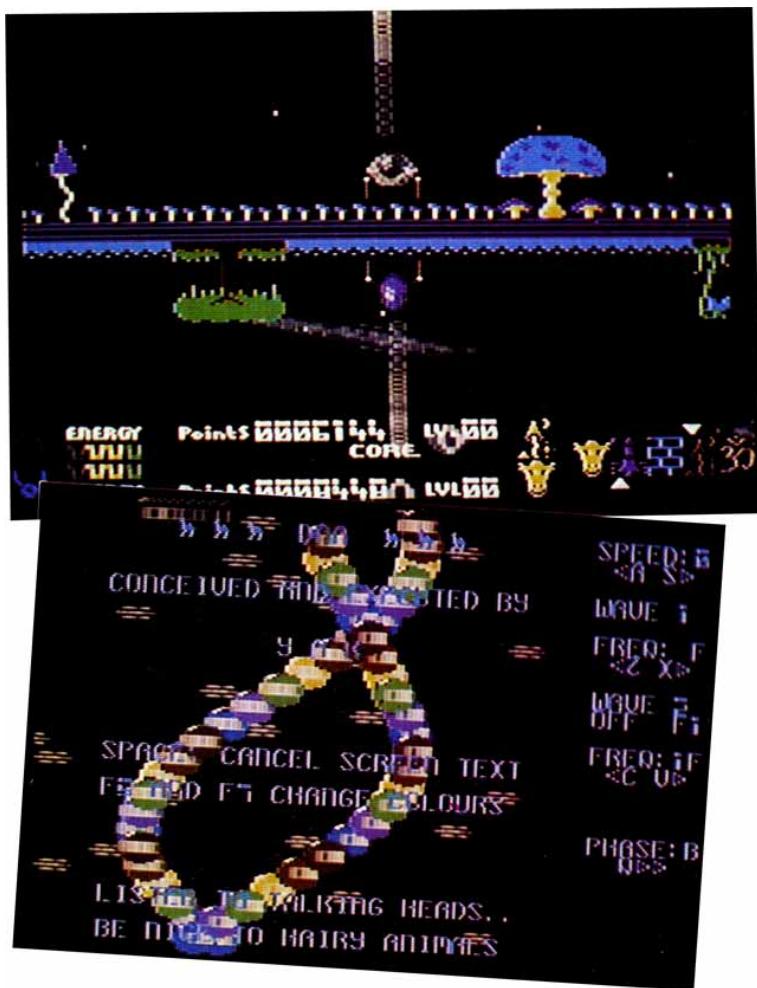

Figure A.6: An early version of the Mushroom planet and the DNA demo.

CBM

The Commodore show was fun, as ever: I met a lot of good people there, and did some serious partying... I don't think Mat or Psy or Wulf are going to forget THAT night for a while. Everything they say about programmers is TRUE. Make of that what you will.

Fatigue

After CBM was over, I spruced up GENESYS and got it to the point where I could actually start doing the attack waves. That's more or less what I've been doing up till now: designing sprite sequences, flight paths, puzzles in some levels, testing 'em to make sure they are not too difficult for mere mortals. After doing about 40 waves and realising that there's still another 60 to go, 'Attack Wave Fatigue' starts to show up, but you just gotta plug on and get 'em done. At the time of writing this I've done 66 of them. I also did a lot of tweaking to the flight mechanics, and designed the display panel and got its various gauges and meters running.

The Core

IRIDIS is unusual in offering two scores, one for each ship. Each ship also has an individual energy bank. As you collide with stuff, you lose energy, naturally. If you lose it all, you DIE. So you shoot some stuff, and as you kill, so energy gets added to your ship's bank. You gotta watch it, though, coz if you collect up too MUCH energy, guess what happens? Yup – you DIE.

Thus, gameplay on IRIDIS involves frequent deliberate collisions, as well as shooting, in order to keep the energy balance cool. There is another way, too: fill up both ships with energy, and then land on the platform (which in the game is known as the CORE). The CORE accepts your excess energy, leaving you with comfortably half-full tanks. Also, if you're coping really heavy flak from a particularly vindictive attack sequence, you can nip along to the CORE and reclaim any energy you might have stashed there during easier times. (Author's note: this new Sabbath album is AWESOME).

Filling up the CORE entirely will grant you a bonus and allow access to Phase II of IRIDIS, that vertically-scrolling thing I mentioned in the last set of notes. You'll have to run the gauntlet of the scrolling course and dump your energy at the end for a mega bonus, then return to main IRIDIS and continue climbing the levels.

Once I finish the attack waves, I gotta tie up all of Phase One before going in to finish Phase II. A rather mean thing is going to be the scoring system – the faster you fly, the more points you get for each killing. Standing still and blasting will earn you no points at all. Flying about at mach III like an F-111 pilot over Libya will net the most points.

Distractions

IRIDIS ALPHA being brought to you despite the following distractions:

Ronnie James Dio in concert (twice) Colourspace II starting to get written on the ST THRUST Time Bandit, Star Raider, Spy Hunter, Joust on the ST The Incredible Bioxwich Trip (Too Weird for Words) Invisible Touch Blade Runner DNA (GOTO YAK and DOWNLOAD!) My assembler politely informing me that every single branch in the whole bit of code was out of range, then trashing my disk CompuNet and all the heroes thereon

I'm a Hero...

As I write this, IRIDIS is nearly completed. I just gave the first pre-production prototype to one of the Hewson mob, ready to be duplicated and dished out to the press at the press launch on Thursday. Getting it ready for the press launch has meant a couple of all-nighters over the last weekend, but it's worth it – I got it done, so I'm a hero...

Phase II

Basically, since last time I wrote, I've been doing Phase II most of the time. I finished off the tricky ACONT routine, and defined the data for all 100 attack waves, then I got down to doing Phase II which was interesting, 'coz it's a vertically scrolling game, and I don't usually do vert-scrollers.

Although I described it before as a loose cross between Phase I of BATALYX and MARBLE MADNESS, it is actually closer to a cross between Phase I of BATALYX and pinball. When you're playing it, you get the odd feeling of actually being the pinball as poor Gilby ricochets off everything in sight at high Delta V. I once saw a pinball game being sold in America which claimed that 'you are the pinball', but when I played it, it turned out to be just a scrolling pin-table, and you were the flippers, not the ball. In Phase II of IRIDIS you are definitely the ball. No doubt about it. And you get hotly pursued by four flying eyeballs.

Figure A.7: A mutated Gilby is surrounded by enemy vessels.

In Phase II there are 256 possible courses, each one different - I worked this trick by generating each level randomly out of 20 or 30 basic components. But, to ensure that each level would be consistent from game to game, I seeded the random number generator with the level number each time the course gets generated. You get distinct courses for each level, but Level 1 will always look like Level 1, for example, and won't be random every time you go in, so, you can make maps and learn the courses as you play. It's neat, 'coz it looks as if I carefully designed and stored all those different courses, and all I really did was call the ol' RAN\$ routine a couple of times. I love cheating.

Well 'ard

I've included a neat high score table, and a new system of graphically displaying the player's progress through the game, as well as progressive opening of the Warp Gate as the player's skill increases. The game now starts up with only one planet, so that new players have a chance without it all being too complicated. Once the third wave (Licker Ships – well 'ard) is passed, the second planet becomes available. As the player goes through the game, more planets become available, and he can sustain his game by earning extra lives on Phase II.

I had a bit of room knocking about under the Kernal so I fitted in my DNA demo; it's available from inside MIF (the little pause mode sub-game I wrote in France).

There's also a title page under there, and a twenty-name Hi Score table (full of default entries like YAK, PSY and MAT, RATT, and various other Compunetters)...

All that's really left for me to do now is final debug, tidying up of rough edges, and add a couple of surprises... maybe. I have a week or so to do that, then it's the end-of-July deadline and if I don't make it I get parts of my anatomy chopped off. I'll do it. I'm a hero, like I said, without even playing BIGGLES.

Figure A.8: The cute 'n' cuddly Gilbies walk along the surfaces of the duo planets

A good 'un

One thing I like about IRIDIS is that it's got very playable, more so than just about any other of my games.

I realised this when I passed the point that comes whenever you write a game: there's always a day when the game stops being just a collection of scroll routines and stuff that you have to run and debug, and starts to become a real game. You know it's happened because you find yourself testing the game even when it doesn't need any testing, and suddenly all your mates know the SYS number to get it started, and use it frequently. IRIDIS passed that point a while back, and it's now well into the 'lights out, heavy rock music on, colour on monitor nice 'n' high, let's go give 'em HELL!' stage. It's great when you've done the high score table and you can rack up a good 'un, too. Remember way back when I started and had nothing much beyond a star scroll, and I said that IRIDIS was gonna blast like crazy? I was right... hehe.

I'm off

After I've finished, I'm off to Corfu for a couple of weeks well-earned rest doing nothing but parascending, lying on the beach, and getting paralytic at Mrs Platypus's bar.

And playing SATAN OF SATURN, the local video game. And listening to 'Brothers in Arms'.

Finally, then, I will leave you, having chronicled the progress of IRIDIS from conception to birth. If you love a blaster then I think you'll like IRIDIS. It's been heavy work, but ultimately worth it, I think.

Long live Gilby! Death to the Zzyaxians!

Distractions

IRIDIS ALPHA being brought to you by YAK the hairy, with the support of the Coca Cola Company, Atari UK, Pink Floyd and Genesis, Heavy Metal, Wadworths 6X, Ratt, Ben, Mat, Psy, Wulf, etc, Compuonet, Dried leaves diffused in boiling water, MIND WALKER, MARBLE MADNESS, STAR GATE, Taun-Tauns, Camels, Llamas, Sheep and Goats... MARBLE MADNESS...

Assembled on a C128 using a partially-finished JCL assembler and the horrible, slow Commodore disk drives. Next time I'm gonna use a 6502 X-ASM running in 2.5 Megabytes of RAM on me trusty ST...

Enemy Data

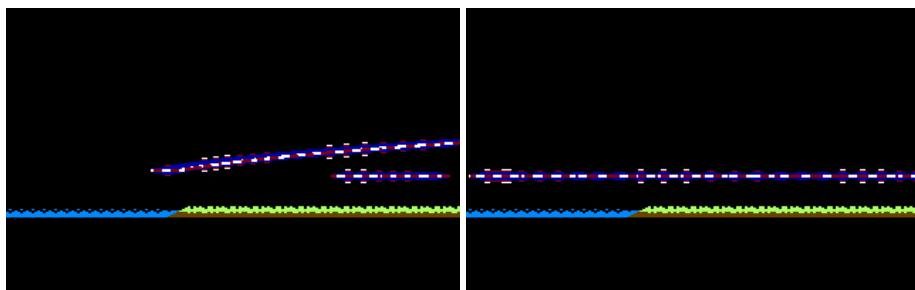

Jeffrey Says

After CBM was over, I spruced up GENESYS and got it to the point where I could actually start doing the attack waves. That's more or less what I've been doing up till now: designing sprite sequences, flight paths, puzzles in some levels, testing 'em to make sure they are not too difficult for mere mortals. After doing about 40 waves and realising that there's still another 60 to go, 'Attack Wave Fatigue' starts to show up, but you just gotta plug on and get 'em done. At the time of writing this I've done 66 of them. I also did a lot of tweaking to the flight mechanics, and designed the display panel and got its various gauges and meters running.

This section provides the level data for each wave of enemies in each planet. Figures are provided to indicate the appearance and movement pattern of the enemy.

Sheep Planet - Level 1 Data

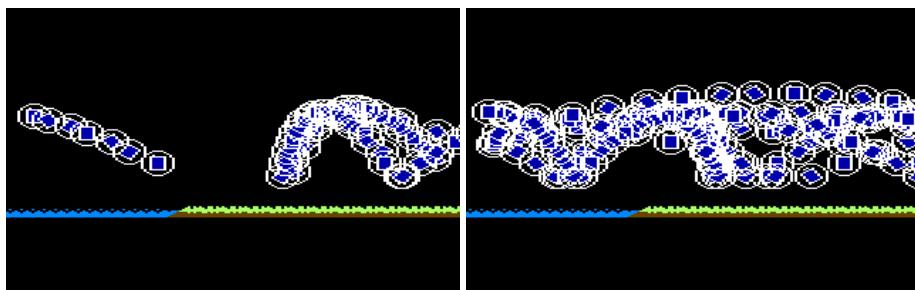

Sample enemy movement for Sheep planet, level 1.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	FLYING_SAUCER1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	FLYING_SAUCER1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$40	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level1Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$06	X Pos movement for attack ship.
Byte 19	\$01	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 1 .

Sheep Planet - Level 2 Data

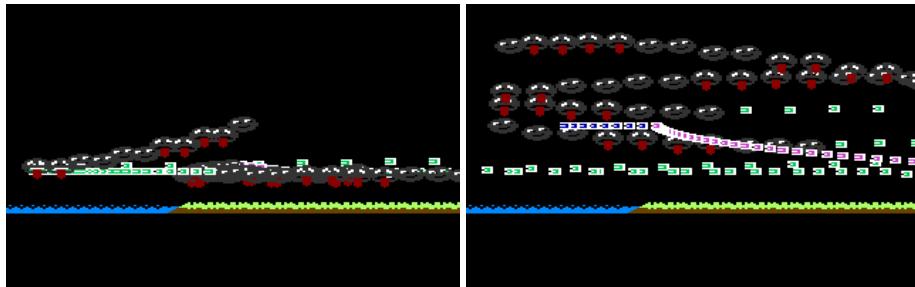

Sample enemy movement for Sheep planet, level 2.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	BOUNCY_RING	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	BOUNCY_RING	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet1Level2Data	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet1Level2Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 2 .

Sheep Planet - Level 3 Data

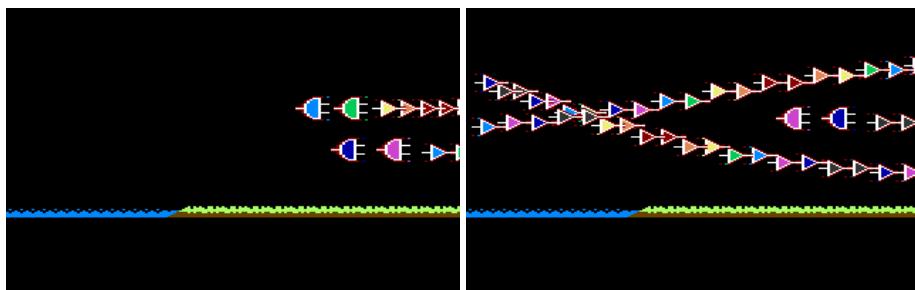

Sample enemy movement for Sheep planet, level 3.

Byte	Value	Description
Byte 0	\$05	Index into array for sprite color
Byte 1-2	FLYING_DOT1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	FLYING_DOT1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$30	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level3Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$FA	X Pos movement for attack ship.
Byte 19	\$01	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	lickerShipWaveData	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 3 .

Sheep Planet - Level 4 Data

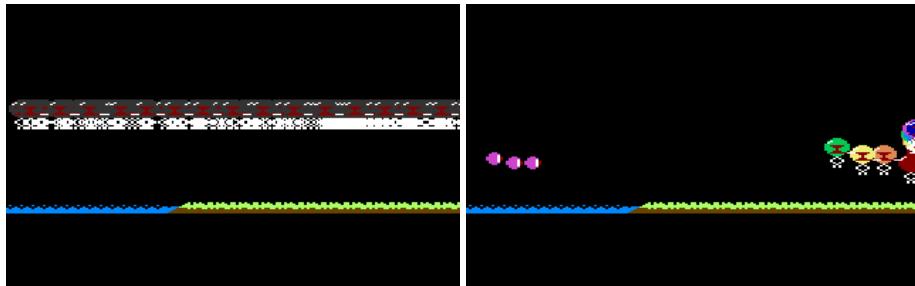

Sample enemy movement for Sheep planet, level 4.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	FLYING_TRIANGLE1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	FLYING_TRIANGLE1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$60	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level4Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$07	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet1Level4Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet1Level4Data2ndStage	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$04	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 4 .

Sheep Planet - Level 5 Data

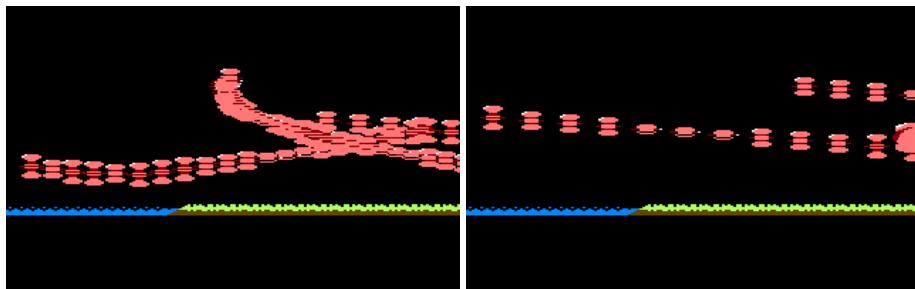

Sample enemy movement for Sheep planet, level 5.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	BALLOON	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	BIRD1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FC	X Pos movement for attack ship.
Byte 19	\$23	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet1Level5Data2ndStage	Pointer for third wave of attack ships.
Byte 28-29	planet1Level5Data3rdStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$05	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 5 .

Sheep Planet - Level 6 Data

Sample enemy movement for Sheep planet, level 6.

Byte	Value	Description
Byte 0	\$0A	Index into array for sprite color
Byte 1-2	BIRD1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	BIRD1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$03	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level6Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings2ndType	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

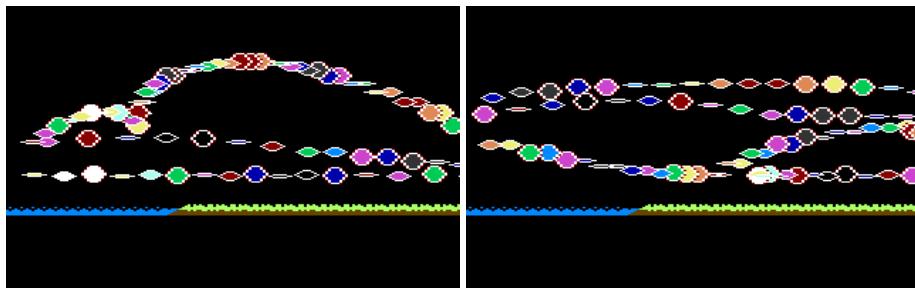

Sheep Planet - Level 6 .

Sheep Planet - Level 7 Data

Byte	Value	Description
Byte 0	\$09	Index into array for sprite color
Byte 1-2	FLAG_BAR	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	FLAG_BAR	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$50	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level7Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$07	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet1Level7Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$28	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 7 .

Sheep Planet - Level 8 Data

Sample enemy movement for Sheep planet, level 8.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$05	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet1Level8Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet1Level8Data2ndStage	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 8 .

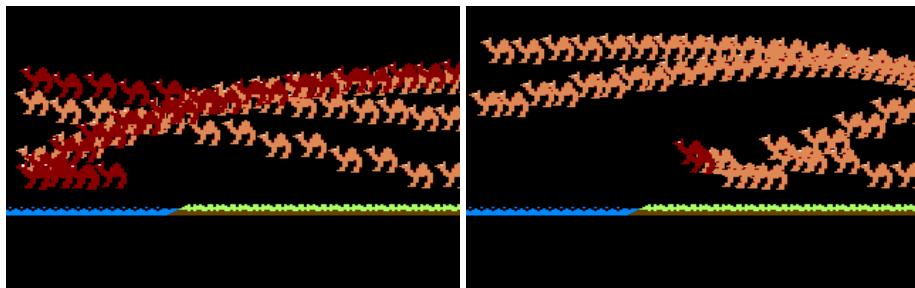

Sheep Planet - Level 9 Data

Sample enemy movement for Sheep planet, level 9.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	WINGBALL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	MONEY_BAG	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$0C	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level9DataSecondStage	Pointer to wave data we switch to periodically.
Byte 18	\$FC	X Pos movement for attack ship.
Byte 19	\$23	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$03	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	planet1Level9DataSecondStage	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	defaultExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$08	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 9 .

Sheep Planet - Level 10 Data

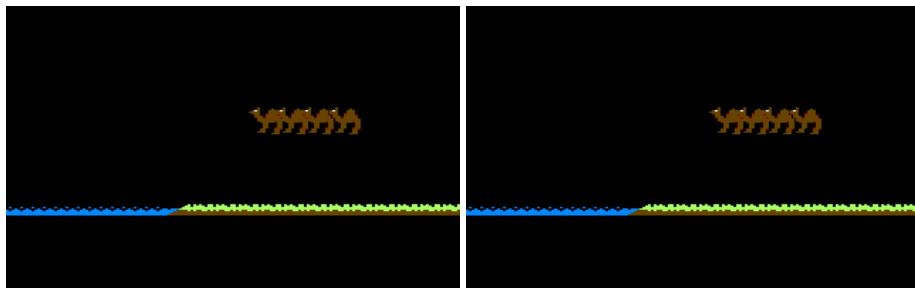

Sample enemy movement for Sheep planet, level 10.

Byte	Value	Description
Byte 0	\$08	Index into array for sprite color
Byte 1-2	CAMEL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	INV_MAGIC_MUSHROOM	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$80	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level10Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$25	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet1Level10Data	Pointer for third wave of attack ships.
Byte 28-29	planet1Level10Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$06	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 10 .

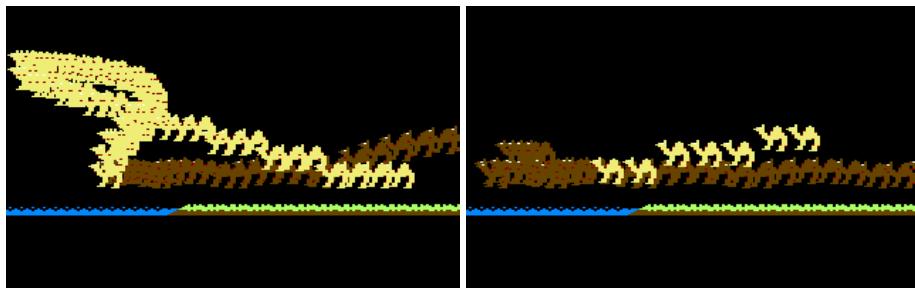

Sheep Planet - Level 11 Data

Sample enemy movement for Sheep planet, level 11.

Byte	Value	Description
Byte 0	\$0E	Index into array for sprite color
Byte 1-2	GILBY_AIRBORNE.LEFT	First and last sprite value for the attack ship on the upper planet
Byte 3	\$06	The animation frame rate for the attack ship.
Byte 4-5	GILBY_AIRBORNE.LOWERPLANET.RIGHT	First and last sprite value for the attack ship on the lower planet
Byte 6	\$03	Rate at which to switch to alternate enemy mode.
Byte 7-8	smallDotWaveData	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$02	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$04	Points for hitting the enemy.
Byte 35	\$05	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

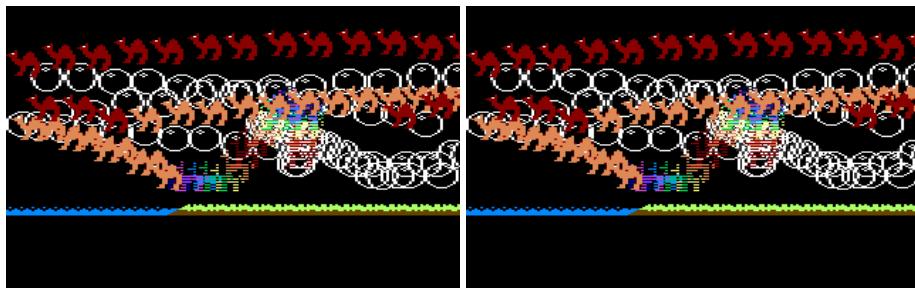

Sheep Planet - Level 11 .

Sheep Planet - Level 12 Data

Sample enemy movement for Sheep planet, level 12.

Byte	Value	Description
Byte 0	\$09	Index into array for sprite color
Byte 1-2	CAMEL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$02	The animation frame rate for the attack ship.
Byte 4-5	LICKERSHIP_INV1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FC	X Pos movement for attack ship.
Byte 19	\$21	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet1Level12Data	Pointer for third wave of attack ships.
Byte 28-29	planet1Level2Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 12 .

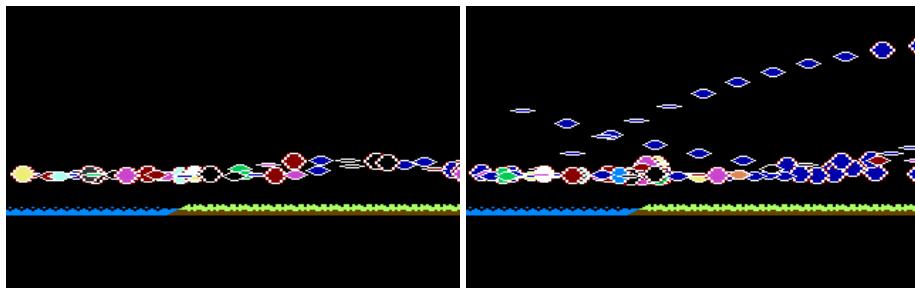

Sheep Planet - Level 13 Data

Sample enemy movement for Sheep planet, level 13.

Byte	Value	Description
Byte 0	\$0B	Index into array for sprite color
Byte 1-2	BUBBLE	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	BUBBLE	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet1Level13Data	Pointer for third wave of attack ships.
Byte 28-29	planet1Level13Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet1Level13Data2ndStage	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$04	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 13 .

Sheep Planet - Level 14 Data

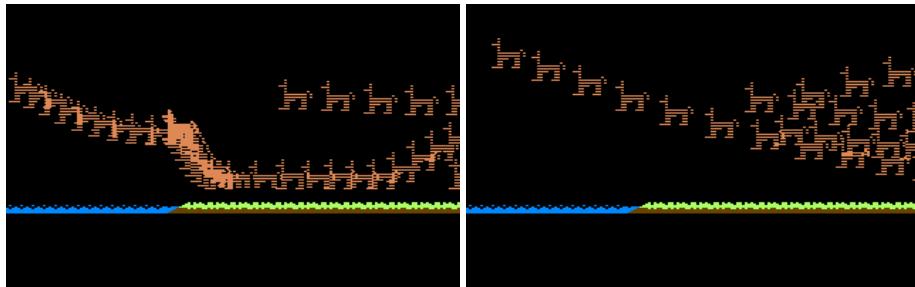

Sample enemy movement for Sheep planet, level 14.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$03	Rate at which to switch to alternate enemy mode.
Byte 7-8	planet1Level8Data	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FA	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet1Level8Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet1Level8Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$08	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 14 .

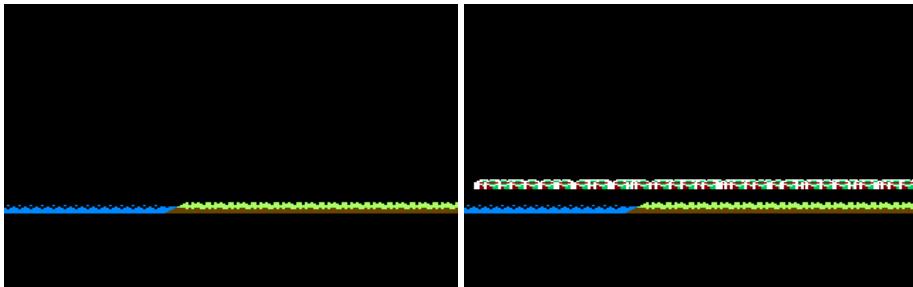

Sheep Planet - Level 15 Data

Sample enemy movement for Sheep planet, level 15.

Byte	Value	Description
Byte 0	\$08	Index into array for sprite color
Byte 1-2	LLAMA	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	LLAMA	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$10	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level15Data	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	teardropExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

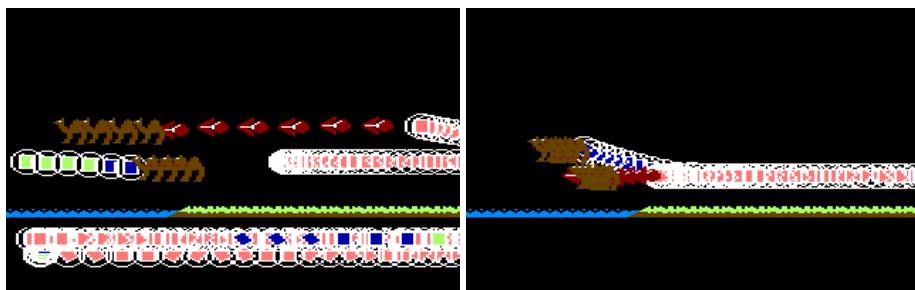

Sheep Planet - Level 15 .

Sheep Planet - Level 16 Data

Sample enemy movement for Sheep planet, level 16.

Byte	Value	Description
Byte 0	\$05	Index into array for sprite color
Byte 1-2	QBERT_SQUARES	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	QBERT_SQUARES	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet4Level19Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$06	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 16 .

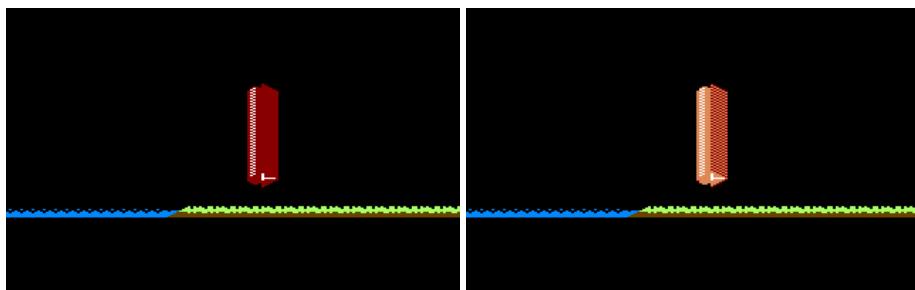

Sheep Planet - Level 17 Data

Sample enemy movement for Sheep planet, level 17.

Byte	Value	Description
Byte 0	\$0A	Index into array for sprite color
Byte 1-2	BOUNCY_RING	First and last sprite value for the attack ship on the upper planet
Byte 3	\$02	The animation frame rate for the attack ship.
Byte 4-5	BOUNCY_RING	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$40	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level17Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$80	X Pos movement for attack ship.
Byte 19	\$80	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	gilbyLookingLeft	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$05	Points for hitting the enemy.
Byte 35	\$0C	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 17 .

Sheep Planet - Level 18 Data

Sample enemy movement for Sheep planet, level 18.

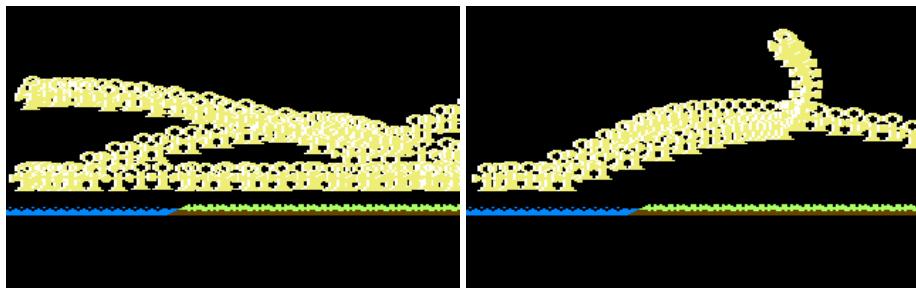

Byte	Value	Description
Byte 0	\$05	Index into array for sprite color
Byte 1-2	GILBY_AIRBORNE.RIGHT	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	GILBY_AIRBORNE.RIGHT	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$06	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet1Level18Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 18 .

Sheep Planet - Level 19 Data

Byte	Value	Description
Byte 0	\$04	Index into array for sprite color
Byte 1-2	STARSHIP	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	STARSHIP	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$20	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level19Data	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$80	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet5Level6Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet5Level6Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 19 .

Sheep Planet - Level 20 Data

Sample enemy movement for Sheep planet, level 20.

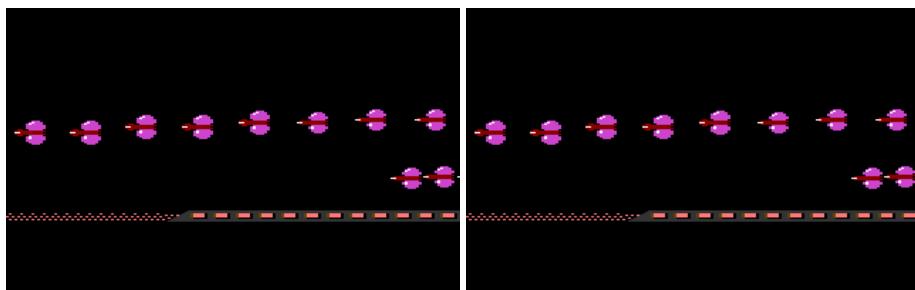

Byte	Value	Description
Byte 0	\$07	Index into array for sprite color
Byte 1-2	COPTIC_CROSS	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	COPTIC_CROSS	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$04	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	copticExplosion	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet1Level20Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet1Level20Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$40	Number of ships in wave.
Byte 39	\$00	Unused byte.

Sheep Planet - Level 20 .

Tech Planet - Level 1 Data

Byte	Value	Description
Byte 0	\$55	Index into array for sprite color
Byte 1-2	LITTLE.DART	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	LITTLE.DART	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$08	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet2Level1Data	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$10	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	pinAsExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

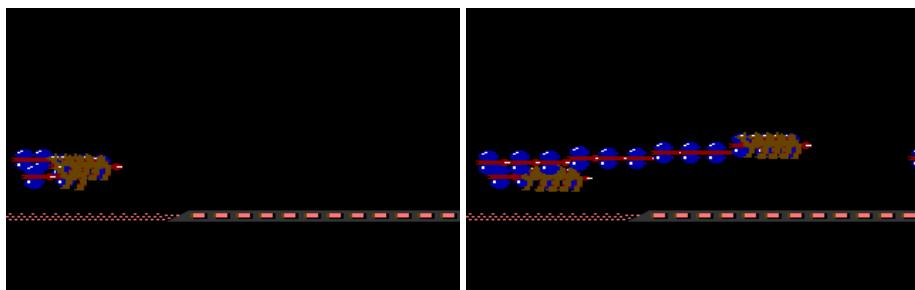

Tech Planet - Level 1 .

Tech Planet - Level 2 Data

Sample enemy movement for Tech planet, level 2.

Byte	Value	Description
Byte 0	\$04	Index into array for sprite color
Byte 1-2	FLYING_COCK1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	FLYING_COCK1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$E9	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

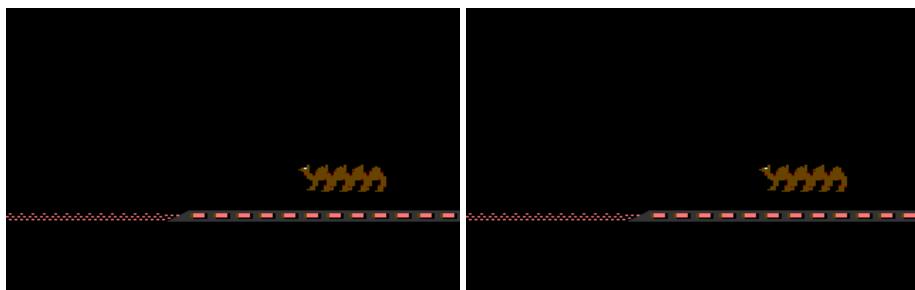

Tech Planet - Level 2 .

Tech Planet - Level 3 Data

Sample enemy movement for Tech planet, level 3.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	FLYING_COCK_RIGHT1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	FLYING_COCK_RIGHT1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$17	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$03	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

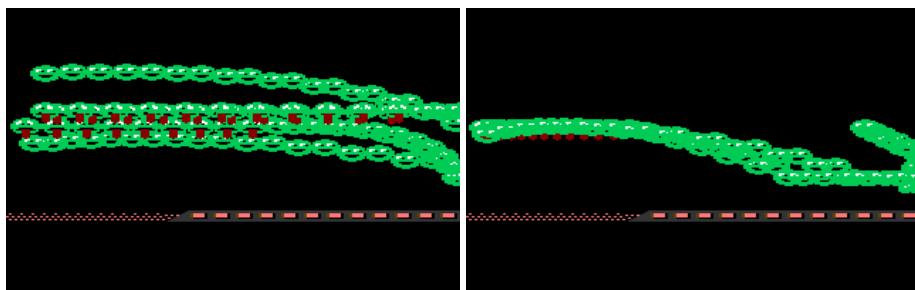

Tech Planet - Level 3 .

Tech Planet - Level 4 Data

Sample enemy movement for Tech planet, level 4.

Byte	Value	Description
Byte 0	\$05	Index into array for sprite color
Byte 1-2	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FC	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$06	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Tech Planet - Level 4 .

Tech Planet - Level 5 Data

Sample enemy movement for Tech planet, level 5.

Byte	Value	Description
Byte 0	\$05	Index into array for sprite color
Byte 1-2	LICKER.SHIP1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	LICKERSHIP_INV1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$06	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet2Level5Data2ndStage	Pointer for third wave of attack ships.
Byte 28-29	planet2Level5Data3rdStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet2Level5Data2ndStage	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$30	Number of ships in wave.
Byte 39	\$00	Unused byte.

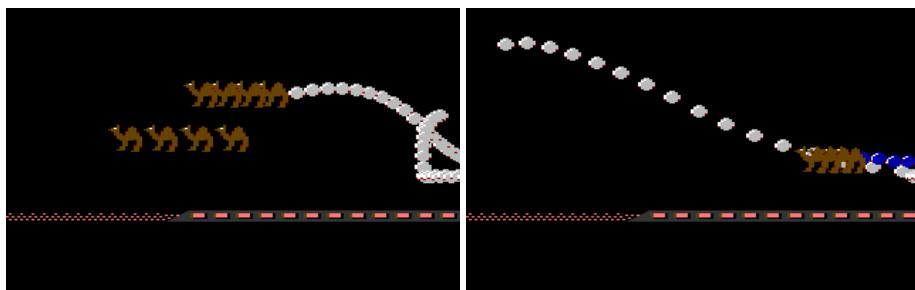

Tech Planet - Level 5 .

Tech Planet - Level 6 Data

Sample enemy movement for Tech planet, level 6.

Byte	Value	Description
Byte 0	\$04	Index into array for sprite color
Byte 1-2	SPINNING_RING1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	SPINNING_RING1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$07	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	planet2Level6Data2ndStage	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

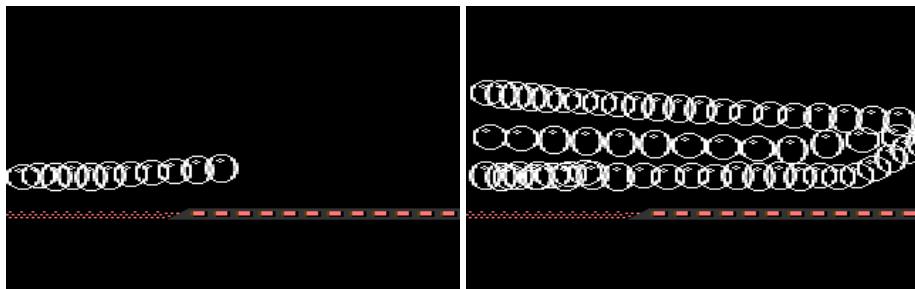

Tech Planet - Level 6 .

Tech Planet - Level 7 Data

Sample enemy movement for Tech planet, level 7.

Byte	Value	Description
Byte 0	\$0F	Index into array for sprite color
Byte 1-2	SMALLBALL AGAIN	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	SMALLBALL AGAIN	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$40	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet2Level7Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$04	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

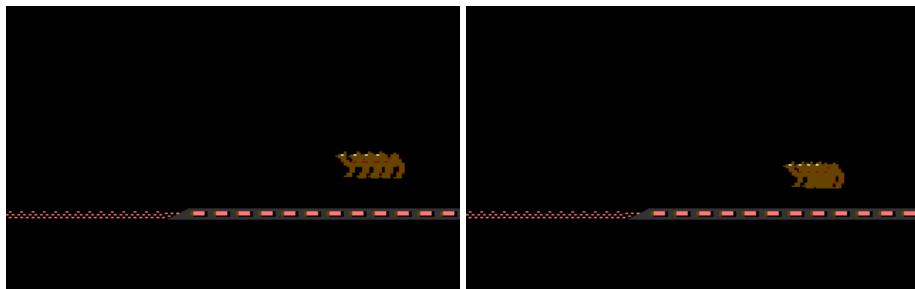

Tech Planet - Level 7 .

Tech Planet - Level 8 Data

Sample enemy movement for Tech planet, level 8.

Byte	Value	Description
Byte 0	\$0C	Index into array for sprite color
Byte 1-2	BUBBLE	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	BUBBLE	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$60	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet2Level8Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet2Level8Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$20	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

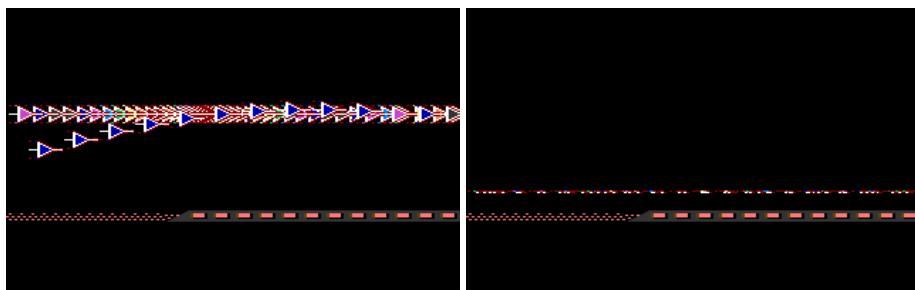

Tech Planet - Level 8 .

Tech Planet - Level 9 Data

Sample enemy movement for Tech planet, level 9.

Byte	Value	Description
Byte 0	\$04	Index into array for sprite color
Byte 1-2	LAND_GILBY1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	LAND_GILBY_LOWERPLANET1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$04	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet2Level9Data	Pointer for third wave of attack ships.
Byte 28-29	gilbyTakingOffAsExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

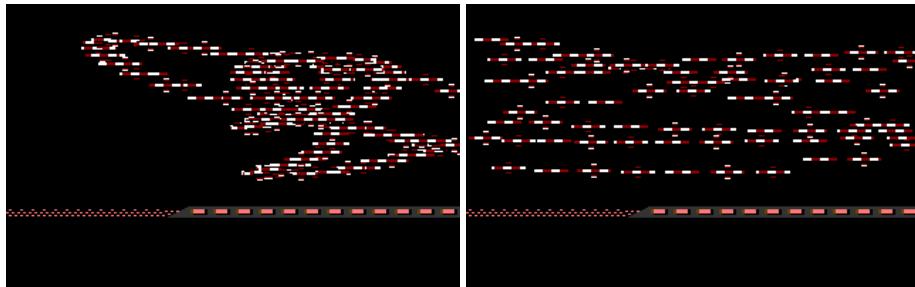

Tech Planet - Level 9 .

Tech Planet - Level 10 Data

Sample enemy movement for Tech planet, level 10.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	FLYING_TRIANGLE1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	FLYING_TRIANGLE1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$06	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	flowchartArrowAsExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$06	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Tech Planet - Level 10 .

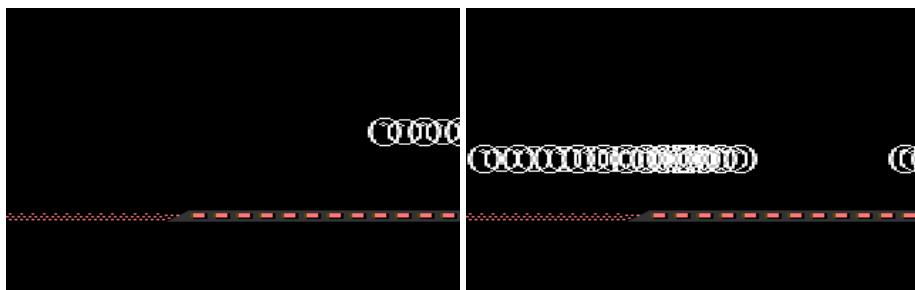

Tech Planet - Level 11 Data

Sample enemy movement for Tech planet, level 11.

Byte	Value	Description
Byte 0	\$00	Index into array for sprite color
Byte 1-2	FLYING_SAUCER1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	FLYING_SAUCER1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$10	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	nullPtr	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet2Level11Data2ndStage	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$00	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

Tech Planet - Level 11 .

Tech Planet - Level 12 Data

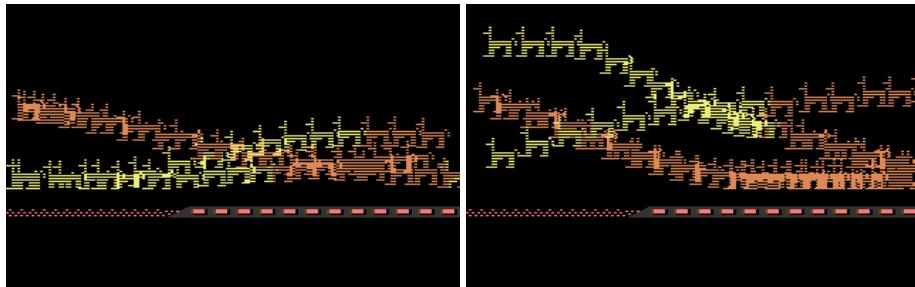

Sample enemy movement for Tech planet, level 12.

Byte	Value	Description
Byte 0	\$0C	Index into array for sprite color
Byte 1-2	BUBBLE	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	BUBBLE	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$03	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet2Level1Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	CAMEL	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$30	Number of ships in wave.
Byte 39	\$00	Unused byte.

Tech Planet - Level 12 .

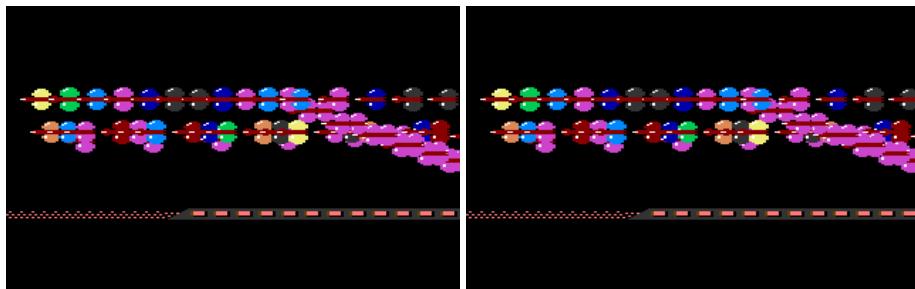

Tech Planet - Level 13 Data

Sample enemy movement for Tech planet, level 13.

Byte	Value	Description
Byte 0	\$08	Index into array for sprite color
Byte 1-2	LLAMA	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	LLAMA	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet2Level13Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$40	Number of ships in wave.
Byte 39	\$00	Unused byte.

Tech Planet - Level 13 .

Tech Planet - Level 14 Data

Sample enemy movement for Tech planet, level 14.

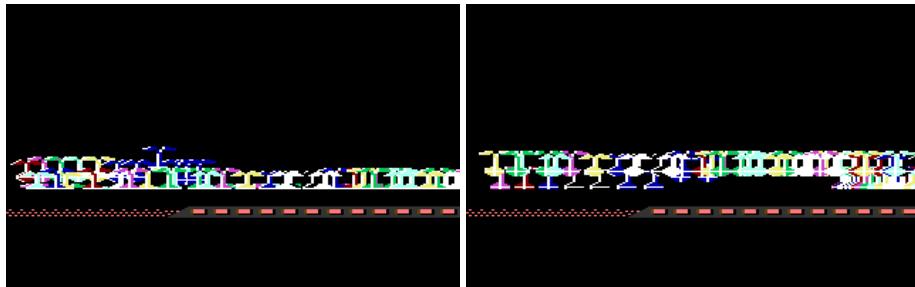

Byte	Value	Description
Byte 0	\$04	Index into array for sprite color
Byte 1-2	FLYING_COCK1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	FLYING_COCK1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$E9	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet2Level14Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Tech Planet - Level 14 .

Tech Planet - Level 15 Data

Byte	Value	Description
Byte 0	\$08	Index into array for sprite color
Byte 1-2	FLAG_BAR	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	FLAG_BAR	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$03	X Pos movement for attack ship.
Byte 19	\$22	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet2Level15Data	Pointer for third wave of attack ships.
Byte 28-29	planet2Level15Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

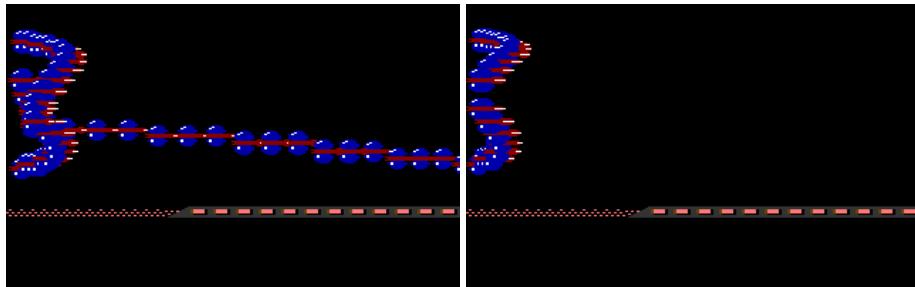

Tech Planet - Level 15 .

Tech Planet - Level 16 Data

Sample enemy movement for Tech planet, level 16.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	WINGBALL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	MONEY_BAG	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FC	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet1Level9Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$10	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$30	Number of ships in wave.
Byte 39	\$00	Unused byte.

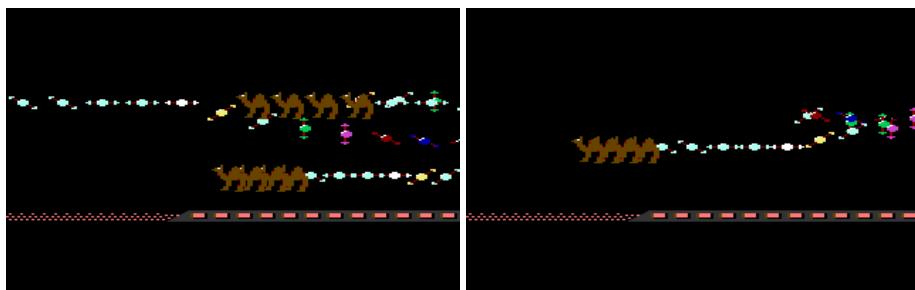

Tech Planet - Level 16 .

Tech Planet - Level 17 Data

Sample enemy movement for Tech planet, level 17.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	FLYING_COCK_RIGHT1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	FLYING_COCK_RIGHT1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$17	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$03	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet2Level17Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

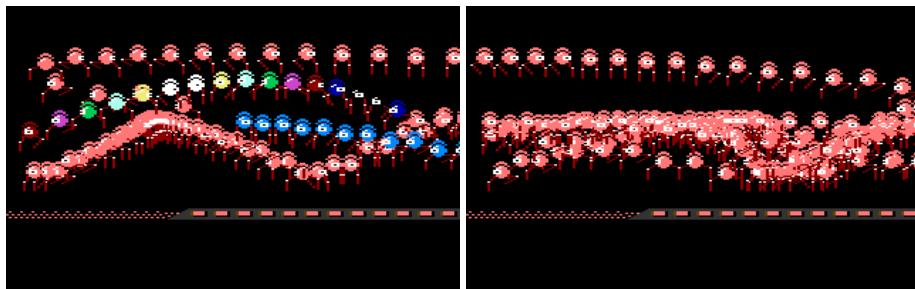

Tech Planet - Level 17 .

Tech Planet - Level 18 Data

Sample enemy movement for Tech planet, level 18.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	BOLAS1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$02	The animation frame rate for the attack ship.
Byte 4-5	BOLAS1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$08	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet2Level18Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	defaultExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$06	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

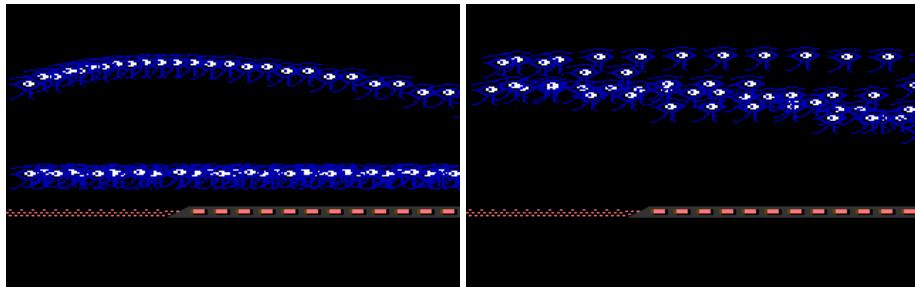

Tech Planet - Level 18 .

Tech Planet - Level 19 Data

Sample enemy movement for Tech planet, level 19.

Byte	Value	Description
Byte 0	\$0E	Index into array for sprite color
Byte 1-2	LAND_GILBY1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	LAND_GILBY_LOWERPLANET1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$0C	Rate at which to switch to alternate enemy mode.
Byte 7-8	landGilbyAsEnemy	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$05	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet2Level19Data	Pointer for third wave of attack ships.
Byte 28-29	planet2Level19Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$04	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$38	Number of ships in wave.
Byte 39	\$00	Unused byte.

Tech Planet - Level 19 .

Tech Planet - Level 20 Data

Sample enemy movement for Tech planet, level 20.

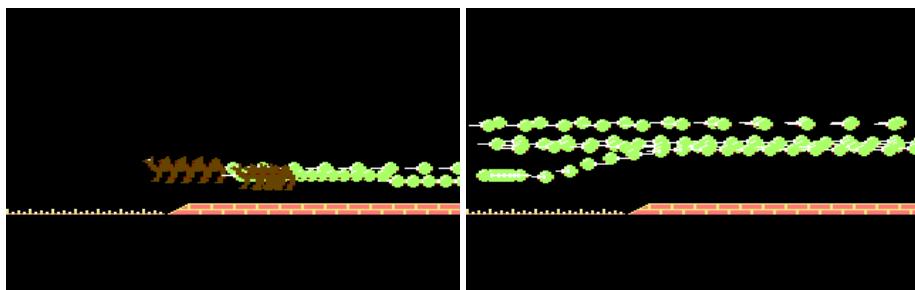

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	EYE_OF_HORUS	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	EYE_OF_HORUS	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FC	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	copticExplosion	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet2Level20Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet2Level20Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$40	Number of ships in wave.
Byte 39	\$00	Unused byte.

Tech Planet - Level 20 .

Brick Planet - Level 1 Data

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	\$FC	First and last sprite value for the attack ship on the upper planet
Byte 3	\$02	The animation frame rate for the attack ship.
Byte 4-5	\$FC	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$20	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet3Level1Data	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	\$50	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$53	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$41	Number of waves in data.
Byte 38	\$56	Number of ships in wave.
Byte 39	\$2A	Unused byte.

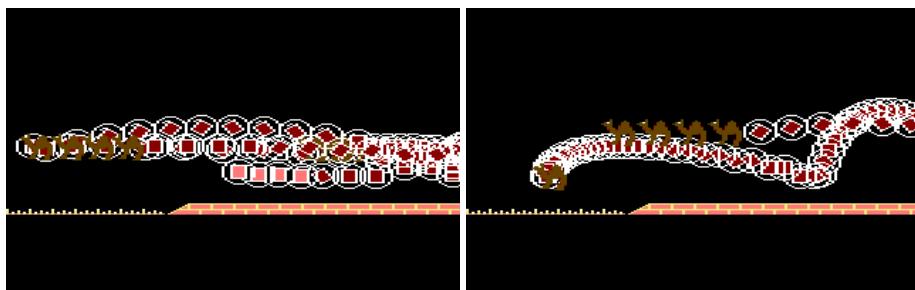

Brick Planet - Level 1 .

Brick Planet - Level 2 Data

Sample enemy movement for Brick planet, level 2.

Byte	Value	Description
Byte 0	\$0D	Index into array for sprite color
Byte 1-2	LITTLE_DART	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	LITTLE_DART	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$50	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet3Level2Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$F8	X Pos movement for attack ship.
Byte 19	\$01	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$0C	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$05	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

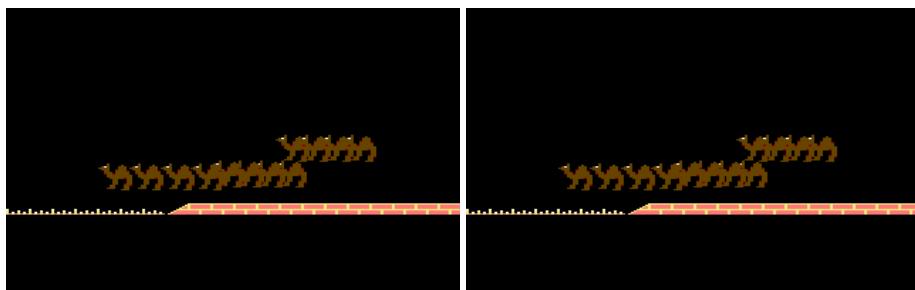

Brick Planet - Level 2 .

Brick Planet - Level 3 Data

Sample enemy movement for Brick planet, level 3.

Byte	Value	Description
Byte 0	\$02	Index into array for sprite color
Byte 1-2	BOUNCY_RING	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	BOUNCY_RING	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$03	X Pos movement for attack ship.
Byte 19	\$23	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet3Level3Data2ndStage	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

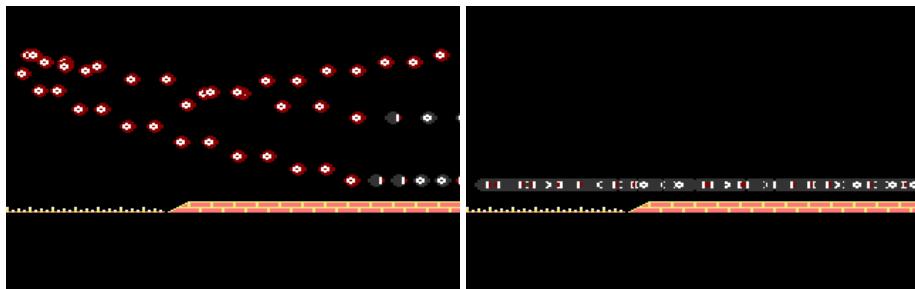

Brick Planet - Level 3 .

Brick Planet - Level 4 Data

Sample enemy movement for Brick planet, level 4.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	GILBY_AIRBORNE_RIGHT	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	GILBY_AIRBORNE_RIGHT	First and last sprite value for the attack ship on the lower planet
Byte 6	\$04	Rate at which to switch to alternate enemy mode.
Byte 7-8	gilbyLookingLeft	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$08	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$03	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$04	Points for hitting the enemy.
Byte 35	\$08	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

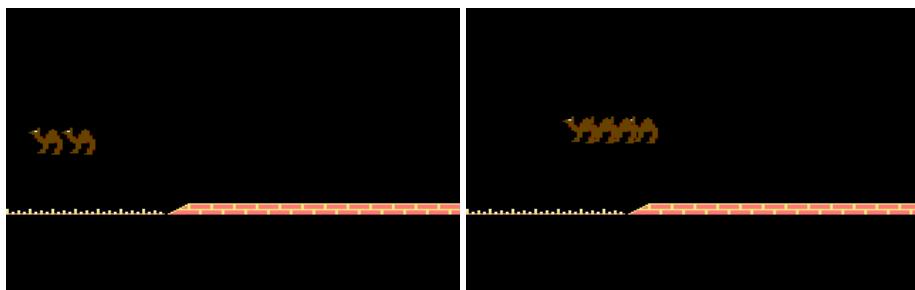

Brick Planet - Level 4 .

Brick Planet - Level 5 Data

Sample enemy movement for Brick planet, level 5.

Byte	Value	Description
Byte 0	\$0B	Index into array for sprite color
Byte 1-2	SMALL_BALL1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$02	The animation frame rate for the attack ship.
Byte 4-5	SMALL_BALL1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	stickyGlobeExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet3Level5Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

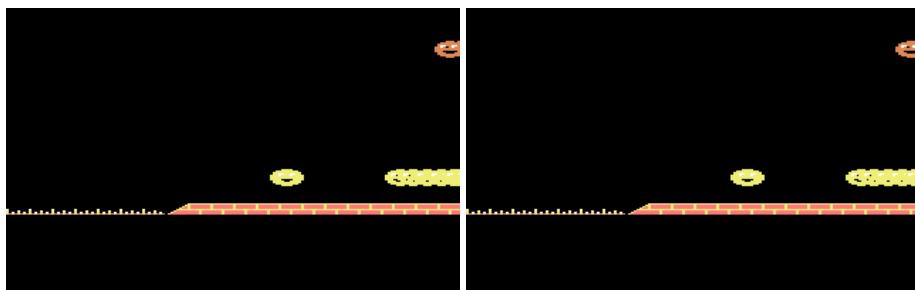

Brick Planet - Level 5 .

Brick Planet - Level 6 Data

Sample enemy movement for Brick planet, level 6.

Byte	Value	Description
Byte 0	\$00	Index into array for sprite color
Byte 1-2	LAND_GILBY1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	LAND_GILBY_LOWERPLANET1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$04	Rate at which to switch to alternate enemy mode.
Byte 7-8	planet3Level6Additional	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$F9	X Pos movement for attack ship.
Byte 19	\$23	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$07	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet3Level6Data	Pointer for third wave of attack ships.
Byte 28-29	planet2Level9Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

Brick Planet - Level 6 .

Brick Planet - Level 7 Data

Sample enemy movement for Brick planet, level 7.

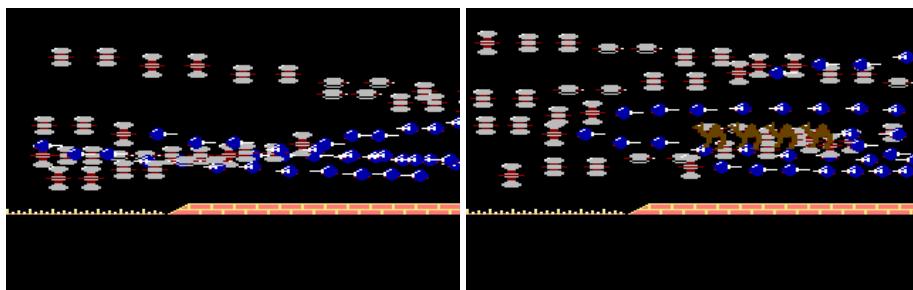

Byte	Value	Description
Byte 0	\$07	Index into array for sprite color
Byte 1-2	LICKER.SHIP1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$07	The animation frame rate for the attack ship.
Byte 4-5	LICKERSHIP_INV1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$03	X Pos movement for attack ship.
Byte 19	\$23	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	planet3Level7Data2ndStage	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Brick Planet - Level 7 .

Brick Planet - Level 8 Data

Byte	Value	Description
Byte 0	\$0C	Index into array for sprite color
Byte 1-2	BUBBLE	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	BUBBLE	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	bubbleExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$0C	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

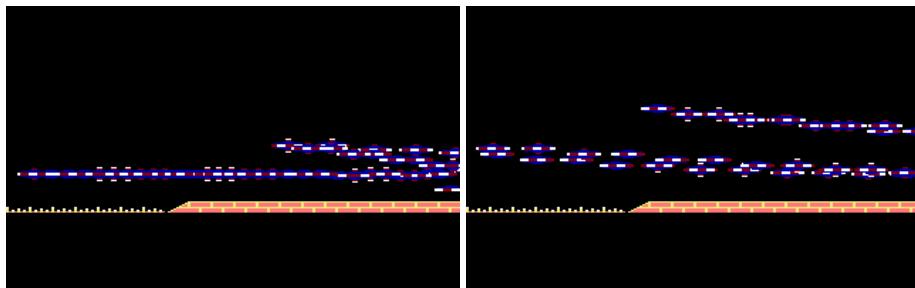

Brick Planet - Level 8 .

Brick Planet - Level 9 Data

Sample enemy movement for Brick planet, level 9.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	FLYING_DART1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	FLYING_DART1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$0C	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet3Level9Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$05	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

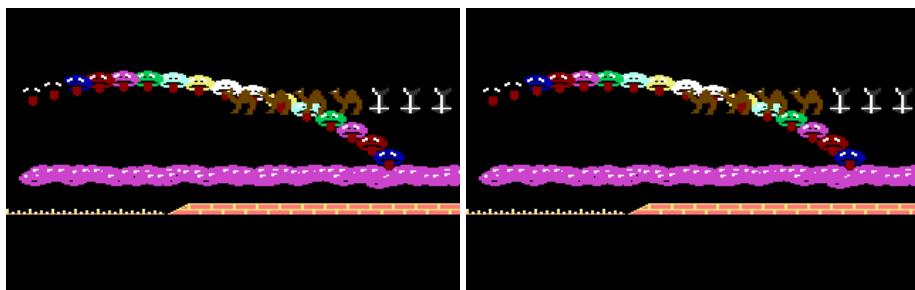

Brick Planet - Level 9 .

Brick Planet - Level 10 Data

Sample enemy movement for Brick planet, level 10.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	FLYING_SAUCER1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	FLYING_SAUCER1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$0A	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet3Level10Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet3Level10Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

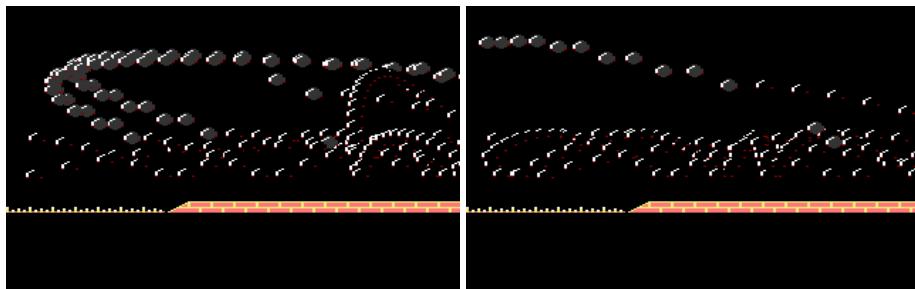

Brick Planet - Level 10 .

Brick Planet - Level 11 Data

Sample enemy movement for Brick planet, level 11.

Byte	Value	Description
Byte 0	\$04	Index into array for sprite color
Byte 1-2	LICKER_SHIP1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	LICKERSHIP_INV1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FD	X Pos movement for attack ship.
Byte 19	\$21	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet3Level11Data	Pointer for third wave of attack ships.
Byte 28-29	planet3Level11Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$08	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

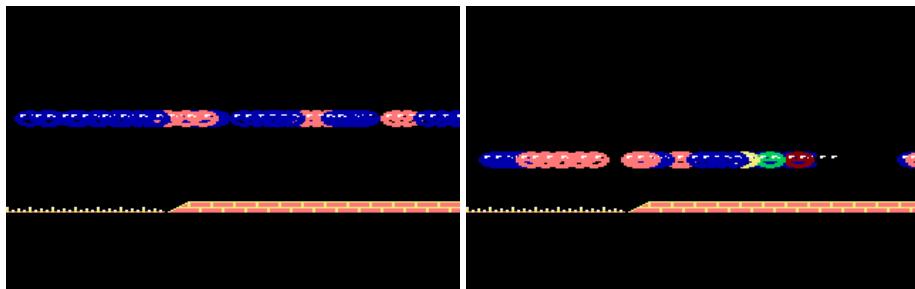

Brick Planet - Level 11 .

Brick Planet - Level 12 Data

Sample enemy movement for Brick planet, level 12.

Byte	Value	Description
Byte 0	\$00	Index into array for sprite color
Byte 1-2	SMALLBALL AGAIN	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	SMALLBALL AGAIN	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$23	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet3Level12Data	Pointer for third wave of attack ships.
Byte 28-29	planet3Level12Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$28	Number of ships in wave.
Byte 39	\$00	Unused byte.

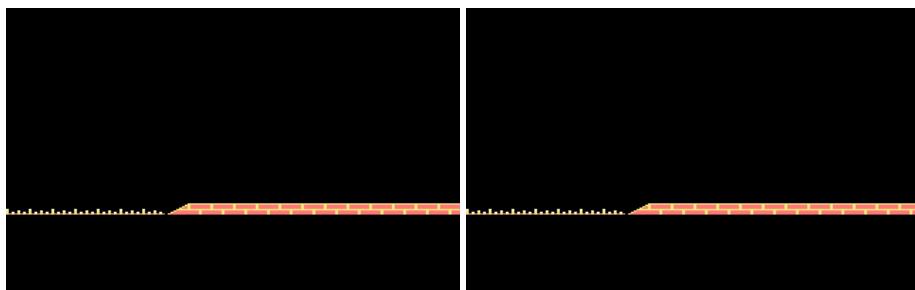

Brick Planet - Level 12 .

Brick Planet - Level 13 Data

Sample enemy movement for Brick planet, level 13.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	LICKER_SHIP1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	LICKERSHIP_INV1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	lickerShipAsExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$05	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

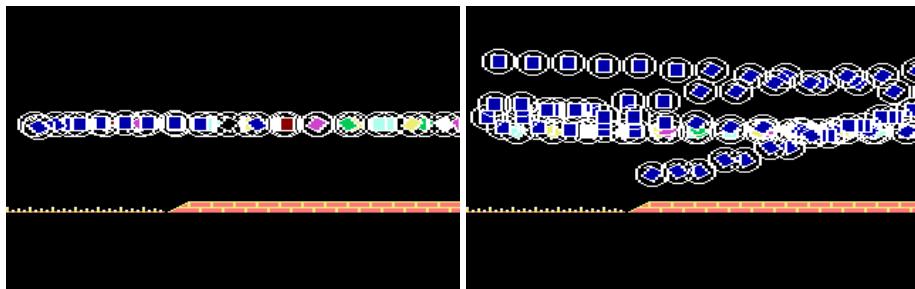

Brick Planet - Level 13 .

Brick Planet - Level 14 Data

Sample enemy movement for Brick planet, level 14.

Byte	Value	Description
Byte 0	\$08	Index into array for sprite color
Byte 1-2	CAMEL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	CAMEL	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$F0	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level12Data	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet3Level14Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$08	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

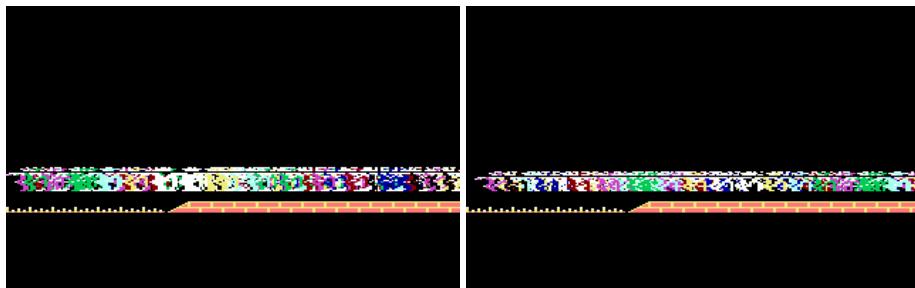

Brick Planet - Level 14 .

Brick Planet - Level 15 Data

Sample enemy movement for Brick planet, level 15.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	BOUNCY_RING	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	BOUNCY_RING	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet3Level15Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$28	Number of ships in wave.
Byte 39	\$00	Unused byte.

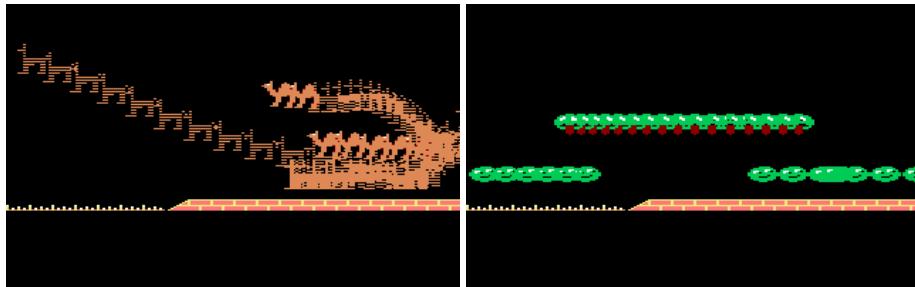

Brick Planet - Level 15 .

Brick Planet - Level 16 Data

Sample enemy movement for Brick planet, level 16.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	STRANGE_SYMBOL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	STRANGE_SYMBOL	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$C0	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet2Level5Data	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet3Level16Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$10	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

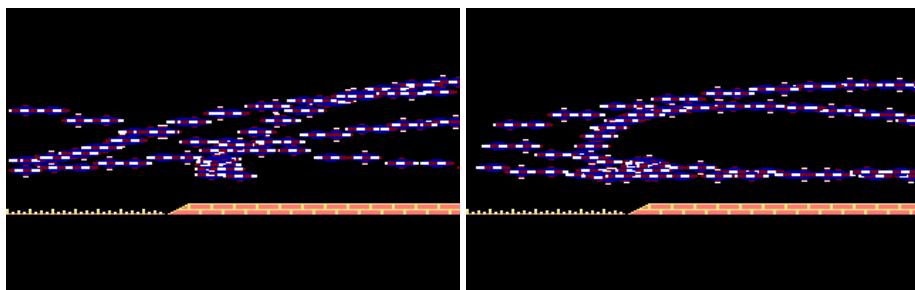

Brick Planet - Level 16 .

Brick Planet - Level 17 Data

Sample enemy movement for Brick planet, level 17.

Byte	Value	Description
Byte 0	\$08	Index into array for sprite color
Byte 1-2	LLAMA	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	LLAMA	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$03	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet5Level14Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$0C	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$30	Number of ships in wave.
Byte 39	\$00	Unused byte.

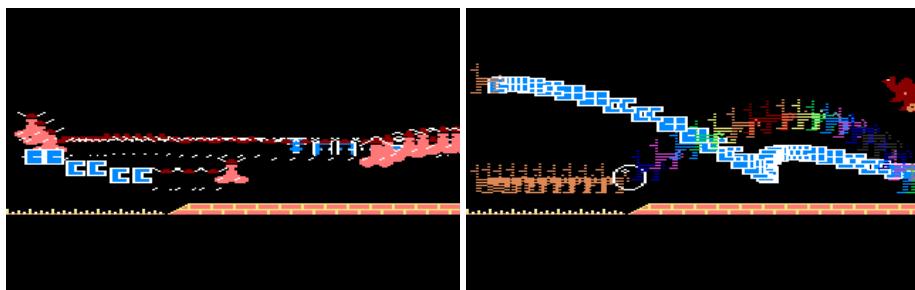

Brick Planet - Level 17 .

Brick Planet - Level 18 Data

Sample enemy movement for Brick planet, level 18.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	FLYING_SAUCER1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	FLYING_SAUCER1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet3Level18Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet3Level18Data2ndStage	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$04	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

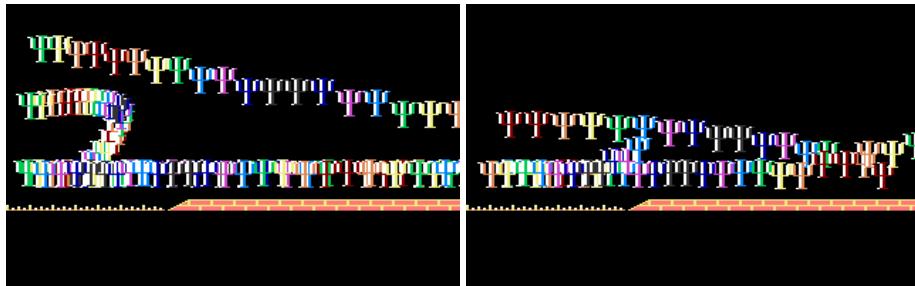

Brick Planet - Level 18 .

Brick Planet - Level 19 Data

Sample enemy movement for Brick planet, level 19.

Byte	Value	Description
Byte 0	\$0E	Index into array for sprite color
Byte 1-2	FLYING_COMMAS1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	FLYING_COMMAS1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$40	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet3Level19Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$05	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet4Level17Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet4Level17Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Brick Planet - Level 19 .

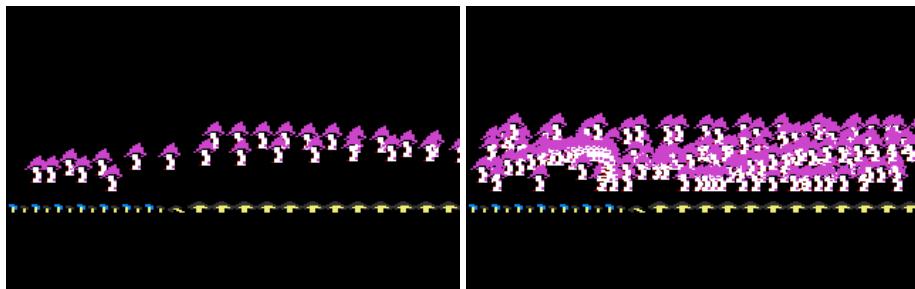

Brick Planet - Level 20 Data

Sample enemy movement for Brick planet, level 20.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	PSI	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	PSI	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$06	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	copticExplosion	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet3Level20Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet3Level20Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$40	Number of ships in wave.
Byte 39	\$00	Unused byte.

Brick Planet - Level 20 .

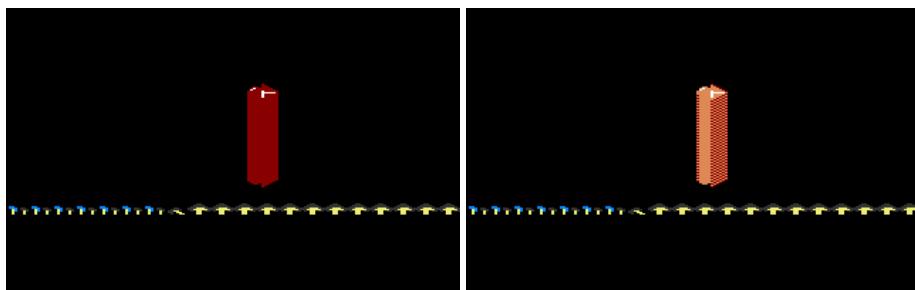

Mushroom Planet - Level 1 Data

Sample enemy movement for Mushroom planet, level 1.

Byte	Value	Description
Byte 0	\$04	Index into array for sprite color
Byte 1-2	MAGIC_MUSHROOM	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	INV_MAGIC_MUSHROOM	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$04	X Pos movement for attack ship.
Byte 19	\$23	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet4Level1Data2ndStage	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 1 .

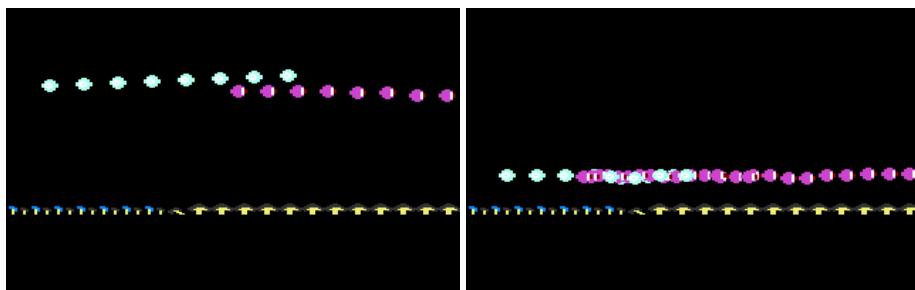

Mushroom Planet - Level 2 Data

Sample enemy movement for Mushroom planet, level 2.

Byte	Value	Description
Byte 0	\$0E	Index into array for sprite color
Byte 1-2	GILBY_AIRBORNE_RIGHT	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	GILBY_AIRBORNE_RIGHT	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$0C	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet4Leve2Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$04	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 2 .

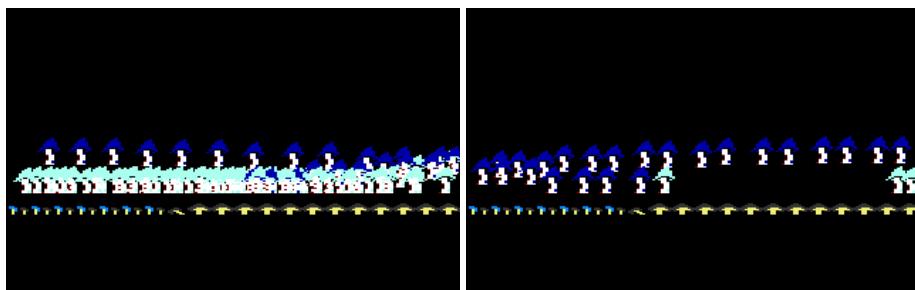

Mushroom Planet - Level 3 Data

Sample enemy movement for Mushroom planet, level 3.

Byte	Value	Description
Byte 0	\$02	Index into array for sprite color
Byte 1-2	LITTLE_DART	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	LITTLE_DART	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$60	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet4Level2Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$03	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$03	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$02	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet1Level5Data3rdStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 3 .

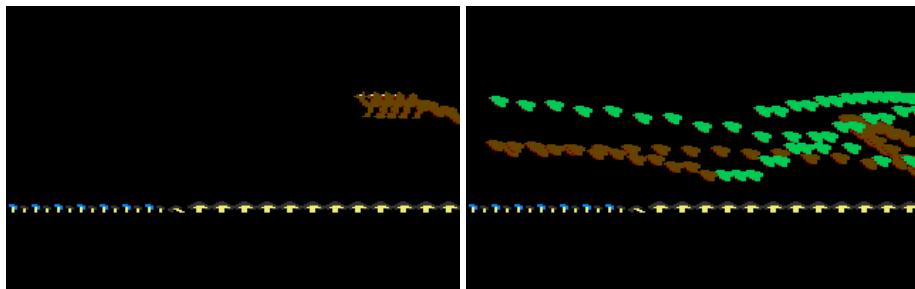

Mushroom Planet - Level 4 Data

Sample enemy movement for Mushroom planet, level 4.

Byte	Value	Description
Byte 0	\$03	Index into array for sprite color
Byte 1-2	MAGIC_MUSHROOM	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	INV_MAGIC_MUSHROOM	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$40	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet4Level4Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 4 .

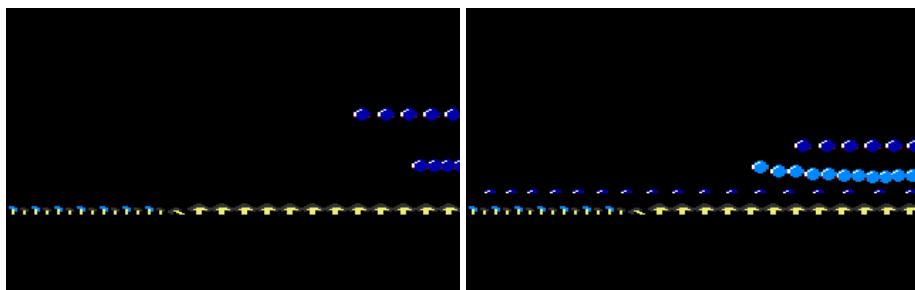

Mushroom Planet - Level 5 Data

Sample enemy movement for Mushroom planet, level 5.

Byte	Value	Description
Byte 0	\$09	Index into array for sprite color
Byte 1-2	LOZENGE	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	LOZENGE	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$04	X Pos movement for attack ship.
Byte 19	\$23	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet4Level5Data2ndStage	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 5 .

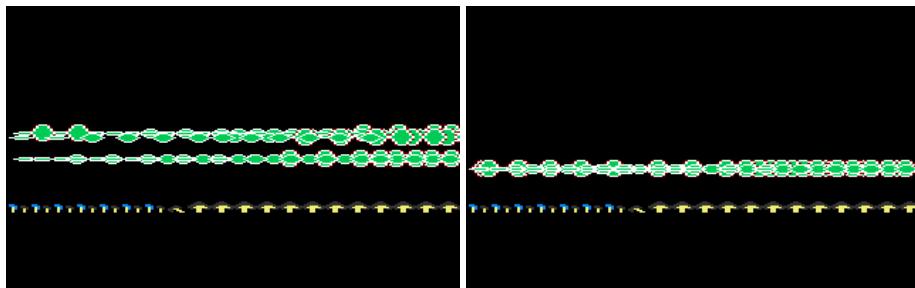

Mushroom Planet - Level 6 Data

Sample enemy movement for Mushroom planet, level 6.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	SMALLBALL AGAIN	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	SMALLBALL AGAIN	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$20	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet4Level6Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 6 .

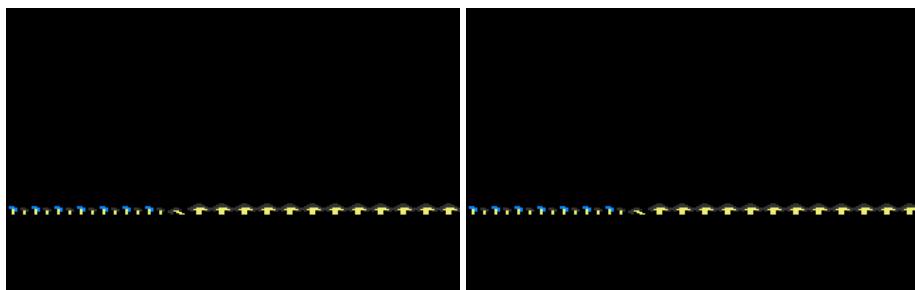

Mushroom Planet - Level 7 Data

Sample enemy movement for Mushroom planet, level 7.

Byte	Value	Description
Byte 0	\$05	Index into array for sprite color
Byte 1-2	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$06	The animation frame rate for the attack ship.
Byte 4-5	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$E0	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet1Level14Data	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	defaultExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$08	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$08	Number of ships in wave.
Byte 39	\$00	Unused byte.

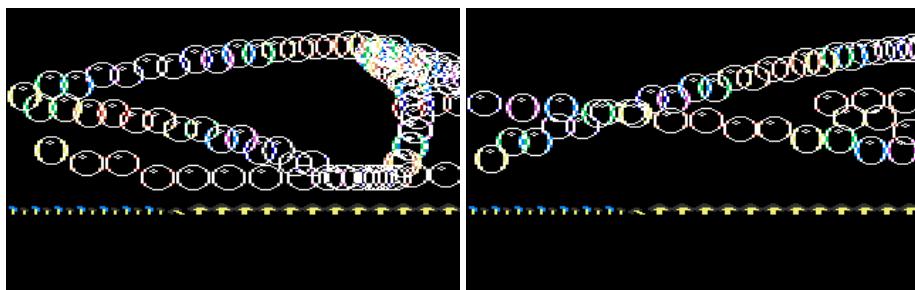

Mushroom Planet - Level 7 .

Mushroom Planet - Level 8 Data

Sample enemy movement for Mushroom planet, level 8.

Byte	Value	Description
Byte 0	\$00	Index into array for sprite color
Byte 1-2	LLAMA	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	LLAMA	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet4Level8Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet4Level8Data2ndStage	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$00	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

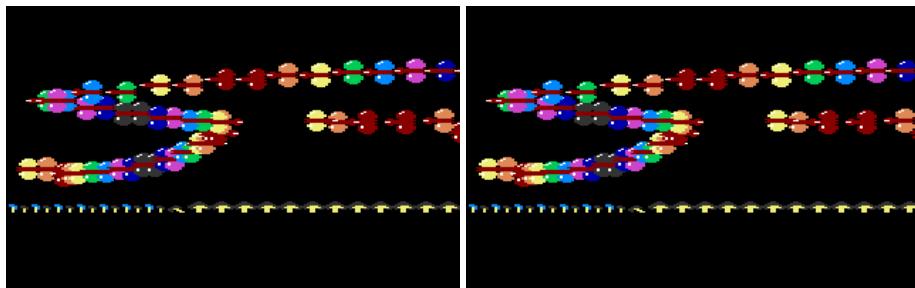

Mushroom Planet - Level 8 .

Mushroom Planet - Level 9 Data

Sample enemy movement for Mushroom planet, level 9.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	BUBBLE	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	BUBBLE	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$80	X Pos movement for attack ship.
Byte 19	\$25	Y Pos movement pattern for attack ship.
Byte 20	\$80	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet4Level9Data2ndStage	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$04	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 9 .

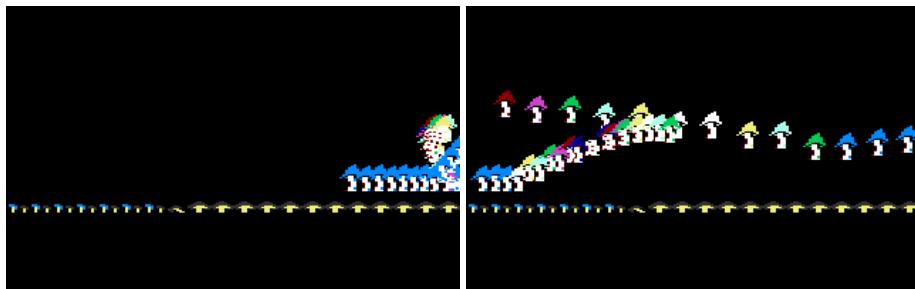

Mushroom Planet - Level 10 Data

Sample enemy movement for Mushroom planet, level 10.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	FLYING_COCK_RIGHT1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	FLYING_COCK_RIGHT1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$10	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet4Level10Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$0A	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$08	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 10 .

Mushroom Planet - Level 11 Data

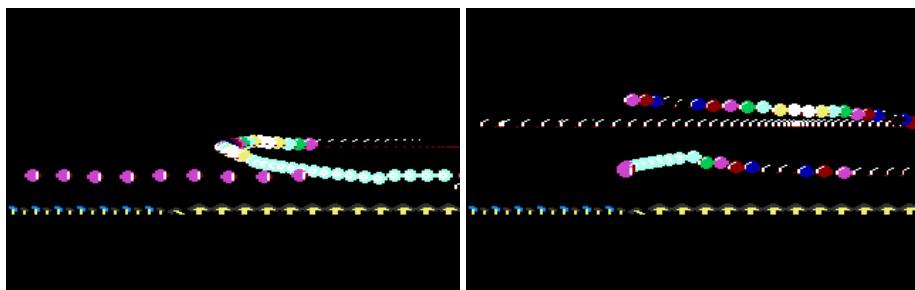

Sample enemy movement for Mushroom planet, level 11.

Byte	Value	Description
Byte 0	\$0E	Index into array for sprite color
Byte 1-2	MAGIC_MUSHROOM	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	INV_MAGIC_MUSHROOM	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$E0	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet4Level11Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet4Level11Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet4Level11Data2ndStage	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 11 .

Mushroom Planet - Level 12 Data

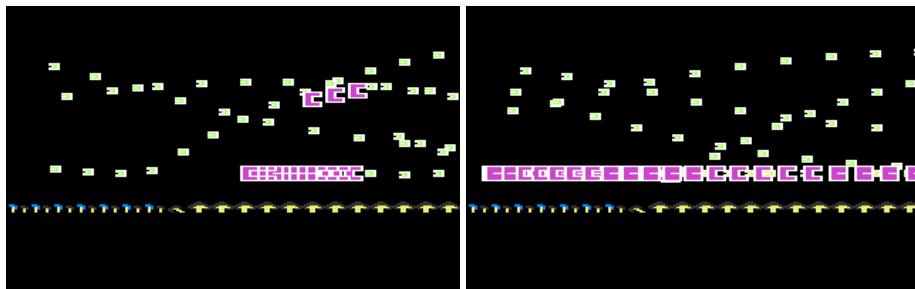

Sample enemy movement for Mushroom planet, level 12.

Byte	Value	Description
Byte 0	\$00	Index into array for sprite color
Byte 1-2	SMALLBALL AGAIN	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	SMALLBALL AGAIN	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet4Level12Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$30	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 12 .

Mushroom Planet - Level 13 Data

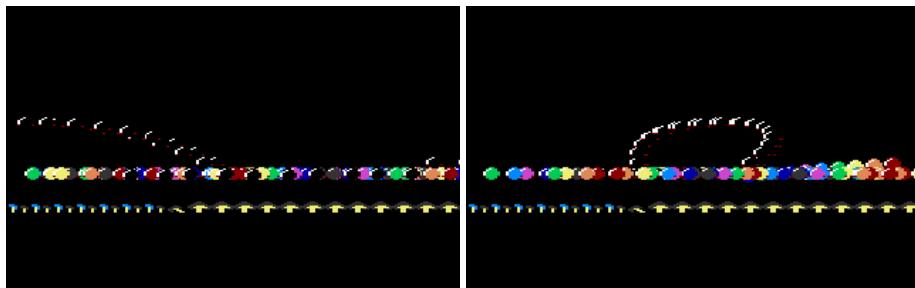

Sample enemy movement for Mushroom planet, level 13.

Byte	Value	Description
Byte 0	\$0D	Index into array for sprite color
Byte 1-2	FLYING_DOT1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	FLYING_DOT1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$F9	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet5Level5Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet5Level5Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$0C	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$40	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 13 .

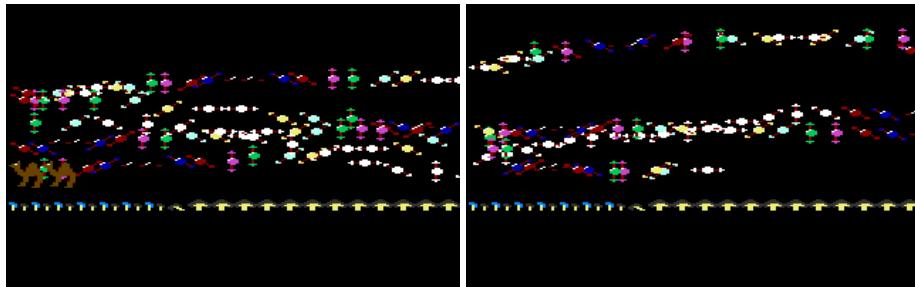

Mushroom Planet - Level 14 Data

Sample enemy movement for Mushroom planet, level 14.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	SMALLBALL AGAIN	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	SMALLBALL AGAIN	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$80	X Pos movement for attack ship.
Byte 19	\$80	Y Pos movement pattern for attack ship.
Byte 20	\$80	X Pos Frame Rate for Attack ship.
Byte 21	\$80	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet4Level14Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$10	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

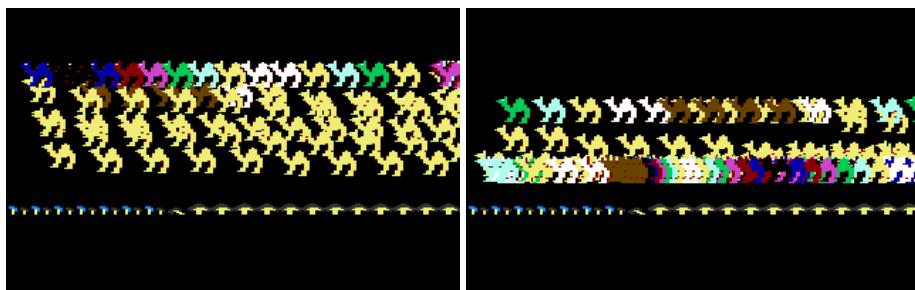

Mushroom Planet - Level 14 .

Mushroom Planet - Level 15 Data

Sample enemy movement for Mushroom planet, level 15.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	BOLAS1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$02	The animation frame rate for the attack ship.
Byte 4-5	BOLAS1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$03	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinnerAsExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$28	Number of ships in wave.
Byte 39	\$00	Unused byte.

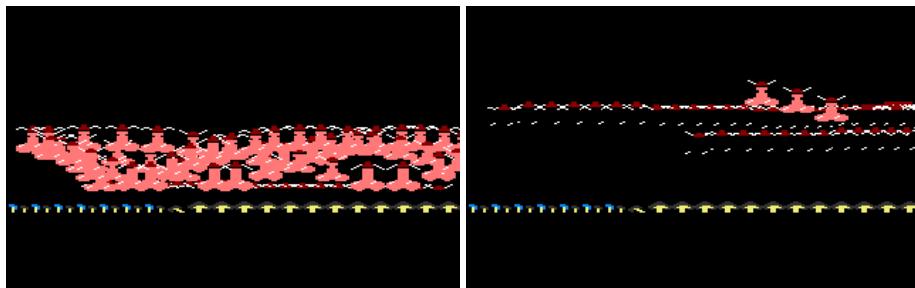

Mushroom Planet - Level 15 .

Mushroom Planet - Level 16 Data

Sample enemy movement for Mushroom planet, level 16.

Byte	Value	Description
Byte 0	\$07	Index into array for sprite color
Byte 1-2	CAMEL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	CAMEL	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$F8	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$04	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet4Level16Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$0C	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$30	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 16 .

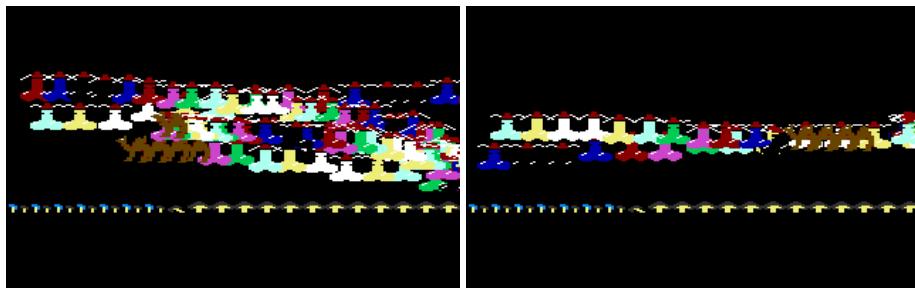

Mushroom Planet - Level 17 Data

Sample enemy movement for Mushroom planet, level 17.

Byte	Value	Description
Byte 0	\$00	Index into array for sprite color
Byte 1-2	CUMMING_COCK1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$06	The animation frame rate for the attack ship.
Byte 4-5	BOLAS1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$04	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	cummingCock	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$0C	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 17 .

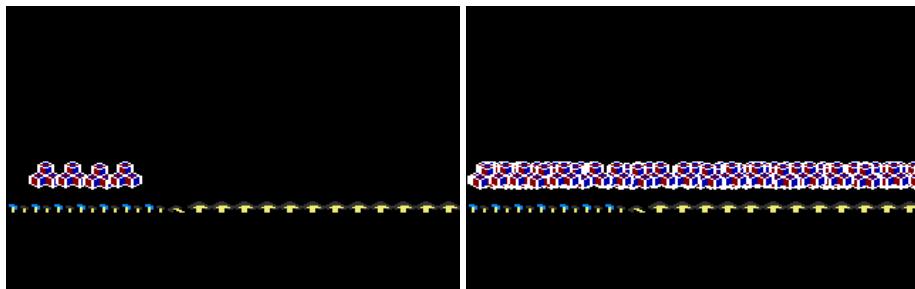

Mushroom Planet - Level 18 Data

Sample enemy movement for Mushroom planet, level 18.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	CUMMING.COOCK1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	LICKERSHIP_INV1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$03	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet4Level18Data	Pointer for third wave of attack ships.
Byte 28-29	secondExplosionAnimation	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 18 .

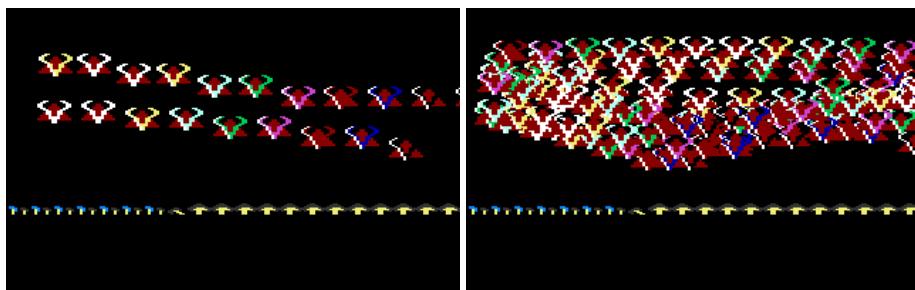

Mushroom Planet - Level 19 Data

Sample enemy movement for Mushroom planet, level 19.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	QBERT_SQUARES	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	QBERT	First and last sprite value for the attack ship on the lower planet
Byte 6	\$01	Rate at which to switch to alternate enemy mode.
Byte 7-8	planet4Level19Additional	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$01	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet4Level19Data	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$08	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$0C	Number of ships in wave.
Byte 39	\$00	Unused byte.

Mushroom Planet - Level 19 .

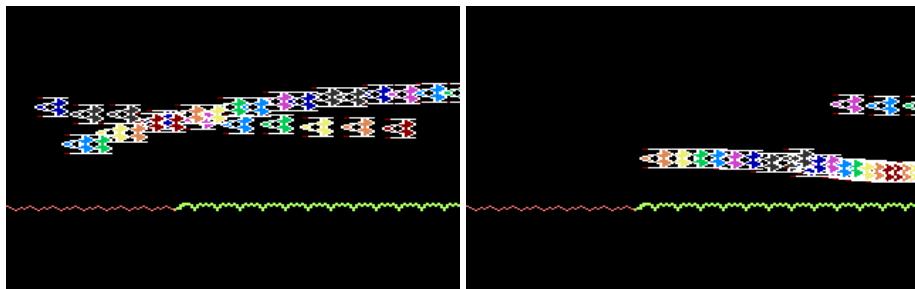

Mushroom Planet - Level 20 Data

Sample enemy movement for Mushroom planet, level 20.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	BULLHEAD	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	BULLHEAD	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FA	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	copticExplosion	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet4Level20Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	planet4Level20Data	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$05	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$05	Number of waves in data.
Byte 38	\$05	Number of ships in wave.
Byte 39	\$05	Unused byte.

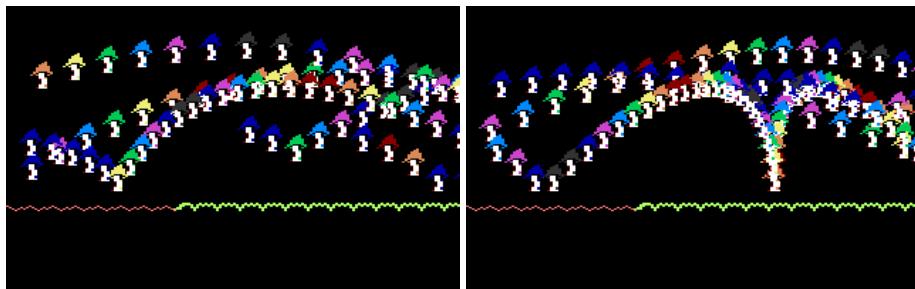

Mushroom Planet - Level 20 .

Om Planet - Level 1 Data

Sample enemy movement for Om planet, level 1.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	STARSHIP	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	STARSHIP	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$60	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet5Level1Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$FC	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Om Planet - Level 1 .

Om Planet - Level 2 Data

Sample enemy movement for Om planet, level 2.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	MAGIC_MUSHROOM	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	INV_MAGIC_MUSHROOM	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$25	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet5Level2Data	Pointer for third wave of attack ships.
Byte 28-29	planet5Level2Explosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$08	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

Om Planet - Level 2 .

Om Planet - Level 3 Data

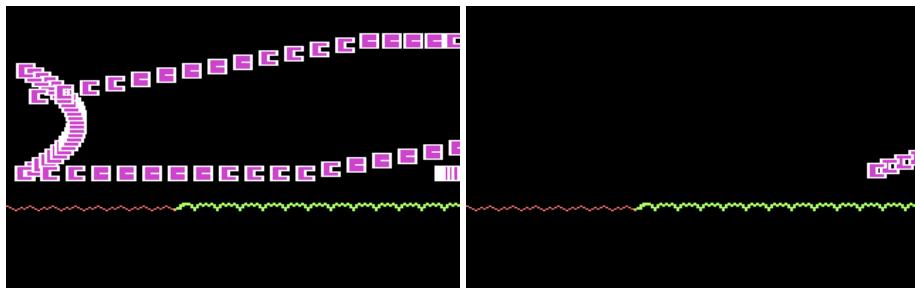

Byte	Value	Description
Byte 0	\$02	Index into array for sprite color
Byte 1-2	LAND_GILBY1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	LAND_GILBY_LOWERPLANET1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$01	Rate at which to switch to alternate enemy mode.
Byte 7-8	planet5Level3Additional	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FD	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet5Level3Data	Pointer for third wave of attack ships.
Byte 28-29	planet5Level3Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$30	Number of ships in wave.
Byte 39	\$00	Unused byte.

Om Planet - Level 3 .

Om Planet - Level 4 Data

Byte	Value	Description
Byte 0	\$0E	Index into array for sprite color
Byte 1-2	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	TEARDROP_EXPLOSION1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$10	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet5Level5Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

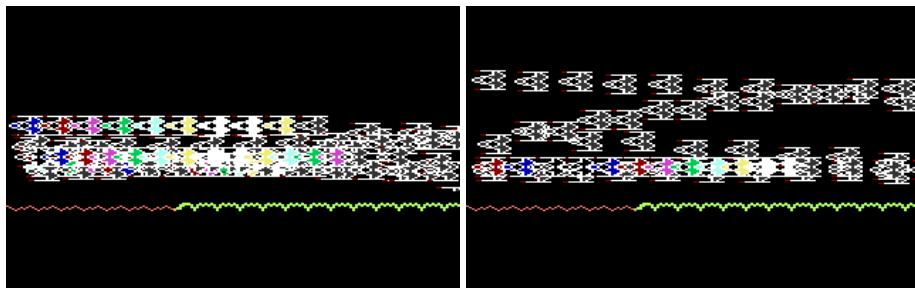

Om Planet - Level 4 .

Om Planet - Level 5 Data

Sample enemy movement for Om planet, level 5.

Byte	Value	Description
Byte 0	\$04	Index into array for sprite color
Byte 1-2	FLYING_COMMA1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$05	The animation frame rate for the attack ship.
Byte 4-5	FLYING_COMMA1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$05	Rate at which to switch to alternate enemy mode.
Byte 7-8	planet5Level5Additional	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$30	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet5Level5Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$07	X Pos movement for attack ship.
Byte 19	\$03	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

Om Planet - Level 5 .

Om Planet - Level 6 Data

Sample enemy movement for Om planet, level 6.

Byte	Value	Description
Byte 0	\$0B	Index into array for sprite color
Byte 1-2	STARSHIP	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	STARSHIP	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$F4	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	fighterShipAsExplosion	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$05	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

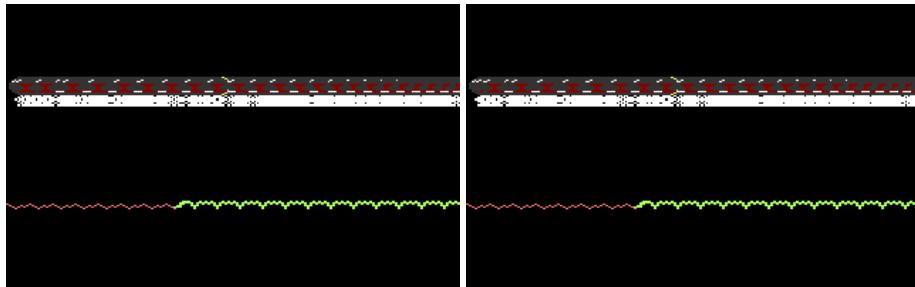

Om Planet - Level 6 .

Om Planet - Level 7 Data

Sample enemy movement for Om planet, level 7.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	FLYING_FLOWCHART1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	FLYING_FLOWCHART1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FE	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet5Level7Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$01	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$20	Number of ships in wave.
Byte 39	\$00	Unused byte.

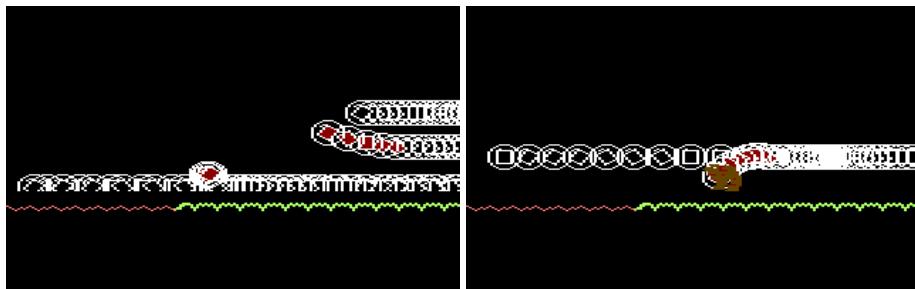

Om Planet - Level 7 .

Om Planet - Level 8 Data

Sample enemy movement for Om planet, level 8.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	BALLOON	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	BOUNCY_RING	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$04	X Pos movement for attack ship.
Byte 19	\$24	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet5Level8Data	Pointer for third wave of attack ships.
Byte 28-29	planet1Level5Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$10	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$30	Number of ships in wave.
Byte 39	\$00	Unused byte.

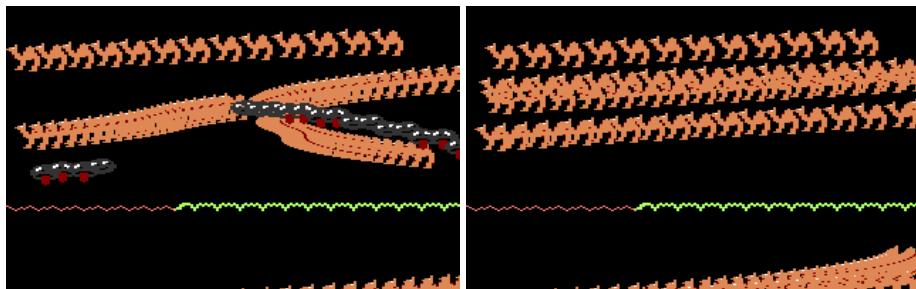

Om Planet - Level 8 .

Om Planet - Level 9 Data

Sample enemy movement for Om planet, level 9.

Byte	Value	Description
Byte 0	\$00	Index into array for sprite color
Byte 1-2	BOUNCY_RING	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	BOUNCY_RING	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$E0	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet5Level9Data2ndStage	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet5Level9Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$02	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$08	Number of ships in wave.
Byte 39	\$00	Unused byte.

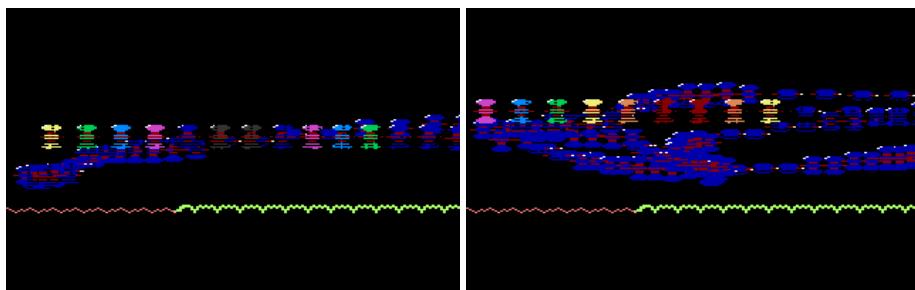

Om Planet - Level 9 .

Om Planet - Level 10 Data

Sample enemy movement for Om planet, level 10.

Byte	Value	Description
Byte 0	\$08	Index into array for sprite color
Byte 1-2	CAMEL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	CAMEL	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$20	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	defaultExplosion	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	lickerShipWaveData	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$03	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

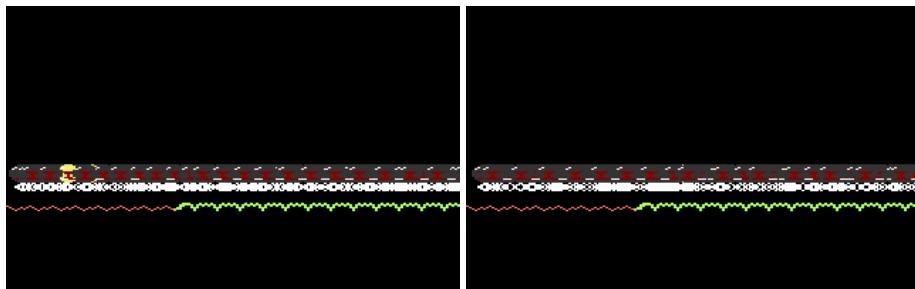

Om Planet - Level 10 .

Om Planet - Level 11 Data

Sample enemy movement for Om planet, level 11.

Byte	Value	Description
Byte 0	\$06	Index into array for sprite color
Byte 1-2	BIRD1	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	BIRD1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$0C	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet5Level11Data	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$10	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet5Level11Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$02	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$18	Number of ships in wave.
Byte 39	\$00	Unused byte.

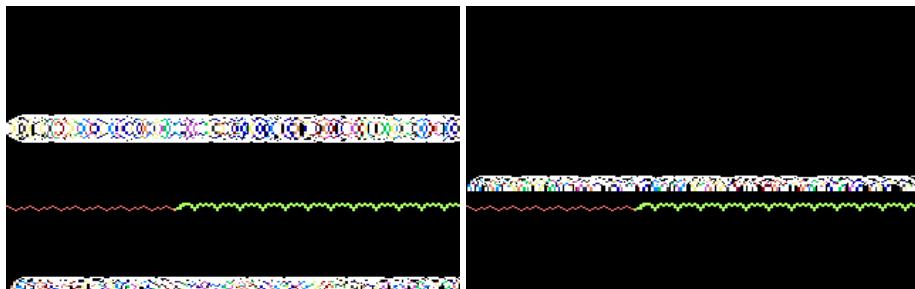

Om Planet - Level 11 .

Om Planet - Level 12 Data

Sample enemy movement for Om planet, level 12.

Byte	Value	Description
Byte 0	\$07	Index into array for sprite color
Byte 1-2	BALLOON	First and last sprite value for the attack ship on the upper planet
Byte 3	\$03	The animation frame rate for the attack ship.
Byte 4-5	LAND_GILBY_LOWERPLANET8	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$23	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$18	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	planet1Level5Data	Pointer for second wave of attack ships.
Byte 26-27	planet5Level12Data	Pointer for third wave of attack ships.
Byte 28-29	nullPtr	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$14	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$04	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$08	Number of ships in wave.
Byte 39	\$00	Unused byte.

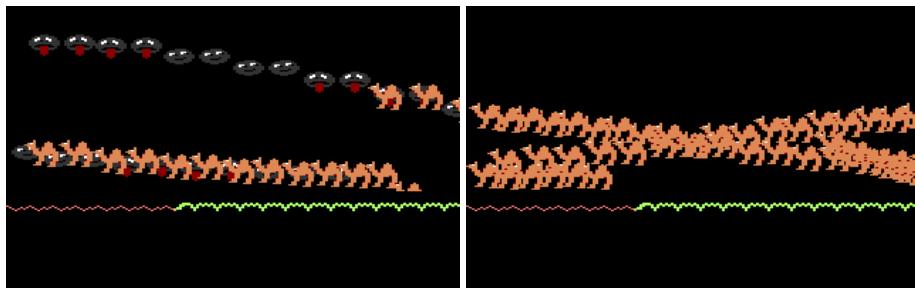

Om Planet - Level 12 .

Om Planet - Level 13 Data

Sample enemy movement for Om planet, level 13.

Byte	Value	Description
Byte 0	\$11	Index into array for sprite color
Byte 1-2	BUBBLE	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	BUBBLE	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet5Level13Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$20	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$C0	Number of ships in wave.
Byte 39	\$00	Unused byte.

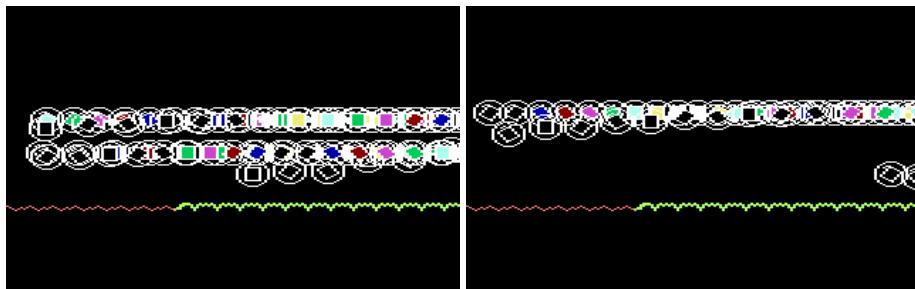

Om Planet - Level 13 .

Om Planet - Level 14 Data

Sample enemy movement for Om planet, level 14.

Byte	Value	Description
Byte 0	\$08	Index into array for sprite color
Byte 1-2	CAMEL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	CAMEL	First and last sprite value for the attack ship on the lower planet
Byte 6	\$06	Rate at which to switch to alternate enemy mode.
Byte 7-8	llamaWaveData	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$FC	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	spinningRings	Pointer for wave to switch to when hit by bullet.
Byte 30-31	lickerShipWaveData	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$03	Points for hitting the enemy.
Byte 35	\$01	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$60	Number of ships in wave.
Byte 39	\$00	Unused byte.

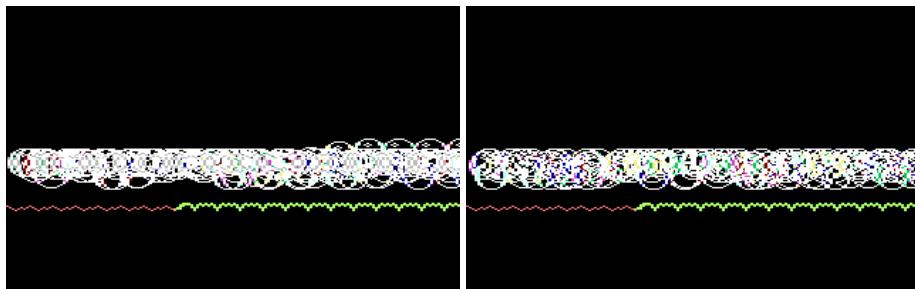

Om Planet - Level 14 .

Om Planet - Level 15 Data

Sample enemy movement for Om planet, level 15.

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	BOUNCY_RING	First and last sprite value for the attack ship on the upper planet
Byte 3	\$04	The animation frame rate for the attack ship.
Byte 4-5	BOUNCY_RING	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$00	X Pos Frame Rate for Attack ship.
Byte 21	\$00	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$00	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet5Level15Data2ndStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$06	Points for hitting the enemy.
Byte 35	\$10	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$10	Number of ships in wave.
Byte 39	\$00	Unused byte.

Om Planet - Level 15 .

Om Planet - Level 17 Data

Sample enemy movement for Om planet, level 17.

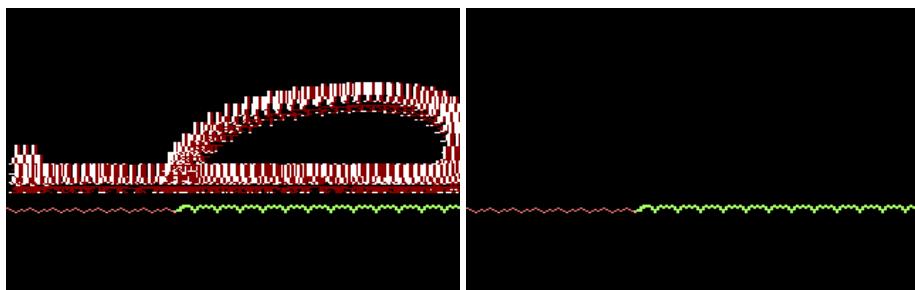

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	BUBBLE	First and last sprite value for the attack ship on the upper planet
Byte 3	\$02	The animation frame rate for the attack ship.
Byte 4-5	BUBBLE	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.
Byte 18	\$02	X Pos movement for attack ship.
Byte 19	\$22	Y Pos movement pattern for attack ship.
Byte 20	\$01	X Pos Frame Rate for Attack ship.
Byte 21	\$01	Y Pos Frame Rate for Attack ship.
Byte 22	\$00	Stickiness factor, does the enemy stick to the player
Byte 23	\$23	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	planet5Level17Data	Pointer for third wave of attack ships.
Byte 28-29	planet3Level8Data	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Points for hitting the enemy.
Byte 35	\$0C	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$30	Number of ships in wave.
Byte 39	\$00	Unused byte.

Om Planet - Level 17 .

Om Planet - Level 18 Data

Byte	Value	Description
Byte 0	\$10	Index into array for sprite color
Byte 1-2	LITTLE_OTHER_EYEBALL	First and last sprite value for the attack ship on the upper planet
Byte 3	\$01	The animation frame rate for the attack ship.
Byte 4-5	SMALL.BALL1	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$30	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	planet5Level18Data	Pointer to wave data we switch to periodically.
Byte 18	\$00	X Pos movement for attack ship.
Byte 19	\$00	Y Pos movement pattern for attack ship.
Byte 20	\$02	X Pos Frame Rate for Attack ship.
Byte 21	\$02	Y Pos Frame Rate for Attack ship.
Byte 22	\$01	Stickiness factor, does the enemy stick to the player
Byte 23	\$01	Does the enemy gravitate quickly toward the player when its hit?
Byte 24-25	nullPtr	Pointer for second wave of attack ships.
Byte 26-27	nullPtr	Pointer for third wave of attack ships.
Byte 28-29	planet1Level5Data3rdStage	Pointer for wave to switch to when hit by bullet.
Byte 30-31	defaultExplosion	Pointer for wave to switch to after colliding with gilby.
Byte 32-33	\$00	Pointer for fourth wave of attack ships.
Byte 34	\$00	Pointe for hitting the enemy.
Byte 35	\$0C	Energy increase multiplier for hitting an enemy.
Byte 36	\$00	Is the ship a spinning ring, i.e. does it allow the gilby to warp?
Byte 37	\$04	Number of waves in data.
Byte 38	\$40	Number of ships in wave.
Byte 39	\$00	Unused byte.

Om Planet - Level 18 .

Om Planet - Level 20 Data

Sample enemy movement for Om planet, level 20.

Byte	Value	Description
Byte 0	\$02	Index into array for sprite color
Byte 1-2	ATARI.ST	First and last sprite value for the attack ship on the upper planet
Byte 3	\$00	The animation frame rate for the attack ship.
Byte 4-5	ATARI.ST	First and last sprite value for the attack ship on the lower planet
Byte 6	\$00	Rate at which to switch to alternate enemy mode.
Byte 7-8	nullPtr	Pointer for alternate enemy mode
Byte 9-10	nullPtr	Unused Pointer to an arbitrary run of Bytes 18-21.
Byte 11	\$00	Unused Rate limit for use of Bytes 9 and 10.
Byte 12-13	nullPtr	Unused Bytes
Byte 14	\$00	Controls the rate at which new enemies are added.
Byte 15	\$00	Update rate for switching to the level data in Bytes 16/17
Byte 16-17	nullPtr	Pointer to wave data we switch to periodically.

Allegro

The musical score consists of ten staves, each representing a different instrument or voice part. The instruments include various woodwind and brass instruments, as well as a vocal part. The score is divided into three sections: 'Previously Generated' (measures 1-6), 'Iridis Alpha Title Theme' (measures 7-10), and 'Generated' (measures 11-14). The key signature changes from C major to G major at measure 7. The tempo is marked as 'Allegro' throughout. The score is highly rhythmic, featuring eighth-note patterns and sixteenth-note figures.

15 Measures

This block contains the musical score for the title theme, spanning 15 measures. The score includes parts for Violin, Viola, Cello, Double Bass, Flute, Clarinet, Bassoon, Trombone, and Tuba. The instrumentation varies across the measures, with some parts appearing in certain measures and not others. The music is set in common time and features a mix of harmonic progressions and rhythmic patterns typical of a film score.

40 of 100,000 (000,000,000)

The sheet music consists of ten staves of musical notation. The instruments represented by the staves are: Bassoon (top), Bassoon, Bassoon, Bassoon, Bassoon, Bassoon, Bassoon, Bassoon, Bassoon, and Bassoon. The music is written in 2/4 time, with a key signature of one sharp (F#). The notes are primarily eighth and sixteenth notes, with some quarter notes and rests. The bassoon parts are mostly sustained notes or simple rhythmic patterns. The overall style is minimalist and repetitive, typical of a title theme.

Afj. Hause

The musical score consists of two staves of music. The top staff is for 'Vocal 1' and the bottom staff is for 'Vocal 2'. Both staves begin with a treble clef, a key signature of one sharp (F#), and a common time signature. The vocal parts are primarily composed of eighth-note patterns, with occasional sixteenth-note figures and rests. The lyrics 'Iridi Alpha Title Theme' are written above the staves, and the copyright notice 'Afj. Hause' is at the bottom right.

71 of 100,000,000,000,000

This musical score page shows two staves for three voices: Voca1, Voca2, and Voca3. The music consists of 16 measures. The first measure starts with a whole note followed by a half note. Measures 2 through 16 each begin with a half note. The notation includes various dynamics like forte and piano, and specific performance instructions such as 'sf' (sforzando) and 'sfz' (sforzando decrescendo). The score is set against a background of a 100,000,000,000,000 grid.

Iridis Alpha Theory describes the inner workings of a relatively obscure video game created by an eccentric Englishman in 1986 for the Commodore 64. 'Iridis Alpha' was not an enormous success on its release but it is widely regarded as one of the great achievements on Commodore 64 hardware.

It embodies an 8-bit arcade aesthetic that was unique to its time, it was slightly mad in its concept and execution, and its emphasis on speed and unforgiving gameplay influenced generations of game developers in the years that followed.

But this book is not just the description of an old computer game. It is a tour through computer technologies that could justifiably be considered antique yet which are still relevant both to the creation of computer games and to the programming of computers in general.

On the other hand, if you are just curious about old computers or the detailed mechanics of how to make a glorified digital breadboard such as the C64 produce something on a screen that flashes, bleeps, and fascinates the viewer, then this book may also be for you.
